Graphical abstract
Abstract:

Here is the report of an environment friendly, rapid, and convenient one-pot ultrasound-promoted synthesis of 5-amino-2-(4-chlorophenyl)-7-substituted phenyl-8,8a-dihydro-7H-[1,3,4]thiadiazolo[3,2-a]pyrimidine-6-carbonitrile derivatives. Multi-component reactions are useful for the creation of chemical libraries of drug-like compounds with levels of molecular complexity and diversity. 1,3,4-Thiadiazolo[3,2-a]pyrimidine skeleton belongs to a well-known and important class of fused heterocycles prevalent in a number of natural products of biological activities including antitumor, fungicidal, antibacterial, and herbicidal, hence, prompted us to synthesis 1,3,4-Thiadiazolo[3,2-a]pyrimidines. The final ten derivatives were obtained in excellent yield through a one-pot, three component condensation reaction of aldehyde, 4-chlorophenyl-2-aminothiadiazole, and malononitrile in 10-12 ml of ethanol as solvent and sodium hydroxide as a catalyst. The same reaction was also carried out by conventional method, which requires 9-10 hrs of refluxing and yield is lesser. Because of the advantage of faster reaction rates and better yields, use of Ultrasound solid probe, was found to be more suitable for this reaction. Structure of the synthesized derivatives was confirmed by IR, NMR and Mass spectral study.

Keywords: 1,3,4-Thiadiazolo[3,2-a]pyrimidine, multi-component reaction, ultrasound-promoted synthesis.
**Introduction:**

Heterocyclic compounds have drawn special attention in organic chemistry because of their abundance in natural products and their diverse biological properties [1]. Pyrimidine and its derivatives have been recognized as important heterocyclic compounds due to their variety of chemical and biological significance to medicinal chemistry [2–3]. During recent years there have been intense investigations on fused thiadiazole and pyrimidine systems. Literature survey revealed that [1,3,4] thiadiazolo[3,2-a]pyrimidine nucleus is associated with diverse pharmacodynamic and chemotherapeutic activities [4,5], including antimicrobial [6,7,8,5] and antitumor activities [4, 6], herbicidal, antifungal, neuramidase inhibitors. 1,3,4-thiadiazolo[3,2-a]pyrimidines have been used as key building blocks for the preparation of a variety of novel bioactive agents.[9]

The conventional multistep methods for the preparation of complex molecules involve large synthetic operations, including extraction and purification processes for each individual step, that lead to synthetic inefficiency and the generation of large amounts of waste. Designing multi-component reactions (MCRs) in one pot and creation of several bonds in a single operation are the major challenge for modern organic chemistry. Multi-component reactions (MCRs) are chemical transformations in which three or more different starting materials combine together via a one-pot procedure to give a final complex product. Recently, MCRs have received great attention from organic chemists which offers important advantages over conventional linear-type synthesis, such as high atom economy, low cost, reduction in overall reaction time and operational simplicity [10-14]. Such reactions have emerged as powerful and bond-forming efficient tools in organic, combinatorial, and medicinal chemistry for their facileness and efficiency as well as their economy and ecology in organic synthesis [15]. They have proven to be fast, convergent, atom efficient reactions and avoiding complicated purifications [12]. MCRs have emerged as a valuable tool in the synthesis of drug libraries because they have significant advantages over conventional reaction strategies to generate biologically active scaffolds with significant structural diversity [16].

Green chemistry has become a major inspiration for organic chemists to develop environmentally benign routes for synthesis of organic compounds of biological values. For instance, performing reactions under ultrasonic irradiation due to the formation of high energy
intermediates to enhance the reaction efficiency from both economical and ecological points has significant synthetic value and received great attention. The waves of ultrasound can be transmitted through any substance containing elastic property. The motion of these sounds is transferred to the particles of the environment, which vibrate in the route of the ultrasound wave. As the molecules oscillate, the molecular distance decreases in the compaction cycle and increases during rarefaction. When the molecular distance exceeds the critical amount necessary to hold the liquid perfect, the liquid collapse; bubbles and cavities are generated. This procedure (cavitation), refers to the generation and the energetic life of bubbles in liquids. The bubbles absorb energy from the waves of ultrasound and grow. Then bubble collapse consequences in pressure changes and high temperature. The solvent vapor suffers fragmentation to produce reactive particles, such as carbenes or free radicals. These high-energy particles are concentrated and lead to intermolecular reactions. In general, the yield of product increases, reactions occur faster, with lower temperatures and minor percentage of by-products achieved [17]. In recent years, ultrasound has been extensively applied as a fantastic tool for different types of chemical reactions [18].

Ultrasound-promoted synthesis has various advantages over conventional synthesis techniques such as highly accelerated reaction rate, reasonable good yields, simple open systems, very less amount of solvents required, eco friendly method, clean heating system, neat and clean synthetic protocol, cheaper reagents and less extreme physical conditions, control on reaction parameters, milder reaction conditions.

The existing synthetic methodologies for [1,3,4] thiadiazolo[3,2-a]pyrimidine nucleus in a modular fashion are not straightforward and the synthetic routes involve multiple steps. For example, 1,3,4-thiadiazolo[3,2-a]pyrimidine-7-sulfonamide derivatives were synthesized from 5-aminol,3,4-thiadiazole-2-sulfonamide via a two step approach.[19] Salimov et al. prepared 2-bromo-7-methyl-5-oxo-5H-1,3,4-thiadiazolo[3,2-a]pyrimidine by two steps involving the addition of 2-aminothiadiazole derivatives to ethyl acetoacetate, tandem hydrolysis of the ester to the acid, and cyclization to give the ring-fused thiadiazolo[3,2-a]pyrimidines in PPA. Most of these are multistep protocols, which suffer from generation of by-products, low yields, and use of metal-containing reagents. Therefore, it is quite significant to develop the direct, efficient, and green alternative approaches to get the functionalized thiadiazolo[3,2-a]pyrimidine derivatives.
from the viewpoint of green chemistry. Herein, we report a new, more simple protocol for a
environment friendly, rapid, and convenient Ultrasound-promoted synthesis of 5H-
[1,3,4]thiadiazolo[3,2-a]pyrimidine-6-carbonitrile derivatives in excellent yield through a one-
pot three component condensation reaction of 5-(4-chlorophenyl )-1,3,4-thiadiazol-2 amine,
aromatic aldehyde and malononitrile using sodium hydroxide as catalyst in ethanol as solvent.

Results and discussion

Chemistry:

Herein we report the one-pot synthesis of novel 5-Amino-2-(4-Chlorophenyl)-7- Substituted
Phenyl-8,8a-Dihydro-7H-[1,3,4]Thiadiazolo[3,2-A]Pyrimidine-6-Carbonitrile Derivatives
from three component reactions of an 5-(4-chlorophenyl )-1,3,4-thiadiazol-2 amine, aromatic
aldehydes and malononitrile in the presence of NaOH under reflux and ultrasonic irradiation as
shown in scheme 1. To determine the optimal reaction conditions, the one pot reactions between
5-(4-chlorophenyl )-1,3,4-thiadiazol-2 amine, aromatic aldehyde, malononitrile was carried out
using different solvents in the presence of NaOH as a catalyst at different mole percentage as
shown in Table 1, the desired product was not formed when H2O was chosen as solvent and
when acetonitrile, methanol and dimethylformamide was chosen as solvent , the desired product
was formed in low yield under reflux and ultrasonic irradiation as shown in Table 2. Proposed
mechanism for the formation of 1,3,4-thiadiazolo[3,2-a]pyrimidine skeleton is as shown in figure
1. All the synthesized compounds were characterized by 1H NMR, 13C NMR, mass spectroscopy
and IR. Physical characterization data of synthesized compound is as shown in Table 2.

Figure 1. Proposed mechanism for the formation of 1,3,4-thiadiazolo[3,2-a] pyrimidine skeleton

**Experimental section**

**General**

All the reactions were performed in oven-dried glassware’s. All reagents and solvents were used as obtained from the supplier or recrystallized/redistilled unless otherwise noted. The ultrasound sonicator (Sonics Vibra-cell, Modelno. VCX 500) equipped with solid synthetic probe, 13 mm in tip diameter, operating at 20 kHz with a maximum power output of 500 W, was used for synthesis of final title compounds. The purity of the synthesized compounds was monitored by ascending thin layer chromatography (TLC) on silica gel-G (Merck) coated aluminium plates, visualized by iodine vapour and melting points were determined in open capillary tubes. The homogeneity of the compounds was monitored by ascending thin layer chromatography (TLC) on silica gel-G (Merck) coated aluminium plates, visualized by iodine vapour. The $^1$H NMR and $^{13}$C NMR spectra of synthesized compounds were recorded on Bruker Avance II 400 NMR Spectrometer at 400 MHz Frequency in deuterated DMSO and CDCl$_3$ and using TMS as internal standard (chemical shift $\delta$ in ppm). Mass spectra of some compounds were scanned on FTMS+p ESI full mass (100.00-1500.00).

Method A: A 25 mL round bottom flask was charged with a mixture of a 5-(4-chlorophenyl)-1,3,4-thiadiazol-2 amine (0.01mol), aromatic aldehyde (0.01mol) in ethanol (10-12 ml) and the catalyst NaOH (20% mmol) and the reaction mixture was refluxed for 1.30-2 h. After completion of the reaction (i.e formation of Schiff base) as indicated by TLC, malononitrile (0.01mol) was added to the reaction mixture and again it was refluxed. After completion of the reaction (monitored by TLC), the mixture was poured into ice cold water. The product obtained, was filtered and dried. The corresponding product was obtained in high purity after recrystallization of the crude product from ethanol. The authenticity of compounds was established by 1H NMR, 13C NMR, IR and HRMS.

Method B: A 25 mL a beaker was charged with a mixture of an 5-(4-chlorophenyl)-1,3,4-thiadiazol-2 amine (0.01mol), aromatic aldehyde (0.01mol) in ethanol (10-12 ml) and the catalyst NaOH (20% mmol) and the reaction mixture was kept inside an Ultrasonicator acoustic chamber at 80°C at 20% amplitude for 10-15 min. After completion of the reaction (i.e formation of Schiff base) as indicated by TLC, malononitrile (0.01mol) was added to the reaction mixture and again was kept inside an Ultrasonicator acoustic chamber at 80°C at 20% amplitude for 1-1.30 hrs. After completion of the reaction (monitored by TLC), the mixture was poured into ice cold water. The product obtained, was filtered and dried. The corresponding product was obtained in high purity after recrystallization of the crude product from ethanol. The authenticity of compounds was established by 1H NMR, 13C NMR, IR and HRMS.

Conclusion

We have developed an efficient multi-component, one-pot method for the synthesis of 5H-[1,3,4]thiadiazolo[3,2-a]pyrimidine-6-carbonitrile derivatives under ultrasound irradiation, by condensation of various aldehydes, 5-(4-chlorophenyl)-1,3,4-thiadiazol-2 amine, and malononitrile in ethanol using sodium hydroxide as catalyst. The present protocol is also extendable to a wide variety of substrates. The advantages of this protocol are use of eco-friendly catalyst, easy work-up, ease of product isolation, and high yield. We believe that this method is a useful condensation reaction for the synthesis of 5H-[1,3,4]thiadiazolo[3,2-a]pyrimidine-6-carbonitrile derivatives.
