### INTRODUCTION & AIM

Zooplankton communities are found in a wide variety of freshwater bodies. The main groups typically represented include rotifers, cladocerans, copepods, protozoa, and fish larvae. Other animal groups may also be present, collectively referred to as tychoplankton or neuston, which include aquatic mites, worms, aquatic beetles, dragonfly larvae, ostracods, and even snails. Unfortunately, little is known about the planktonic communities inhabiting lentic environments in Corrientes due to a lack of research. This study aims to investigate the zooplankton communities in a lentic environment in northern Corrientes to better understand their diversity within this ecosystem.

### METHOD

Sampling was conducted in April 2024 (autumn) at Totorá Lagoon in San Cosme, Corrientes, Argentina. Water samples were collected using plastic buckets from the littoral zone. Floating macrophyte plants, *Salvinia natans* (L.) All and submerged *Egeria densa* Planch., were extracted. Additionally, the physicochemical parameters of the water were measured at the time of sampling. In the laboratory, leaves and roots of macrophyte plants were examined in vivo using a stereoscopic binocular loupe and a compound microscope. The same instruments were used for the fixed samples, and a photographic record was made, whose images were used for identification and taxonomic classification.

### RESULTS & DISCUSSION

The physicochemical parameters measured on the day of sampling showed the following values: oxygen at 7 mg/L, conductivity at 91 µS/cm, and pH at 7.6 and the total dissolved solids (TDS) at 46 ppm. The water temperature reached 27.1 °C during the morning hours when the macrophytes were collected. A total of 15 phyla and 46 genera were identified, ranging from protists to arthropods (Table 1). The groups with the largest and most diverse specimens were Amoebozoa and Ciliophora. Many of the individuals found could not be identified down to species or even family, so they were classified as "undetermined."

### CONCLUSION

These results demonstrate a remarkable diversity of species in Totorá Lagoon. Additionally, species indicative of specific environmental conditions were identified. The presence of two species of coanoflagellates, two species of hydra, and the annelid *Pristina* sp. is highlighted for the first time in Corrientes (Fig. 1). This study represents the first record of planktonic communities in a lentic environment in Corrientes, Argentina, contributing to regional diversity. These findings could prove valuable for future research in the fields of ecology, biogeography, and biology.

Table 1. List of zooplankton species recorded in Totorá Lagoon, San Cosme, Corrientes, Argentina, in April 2024.

| Taxa                   | Orden             | Family          | Genus         | Specie                       |
|------------------------|-------------------|-----------------|---------------|------------------------------|
| <b>Amoebozoa</b>       |                   |                 |               | Monopodial                   |
|                        |                   |                 |               | Multipodial                  |
|                        | Arcellinida       | Arcellidae      | Arcella       | <i>A. conica</i>             |
|                        | Arcellinida       | Arcellidae      | Arcella       | <i>A. costata</i>            |
|                        | Arcellinida       | Arcellidae      | Arcella       | <i>A. gibbosa</i>            |
|                        | Arcellinida       | Arcellidae      | Arcella       | <i>A. mitrata</i>            |
