# Outline

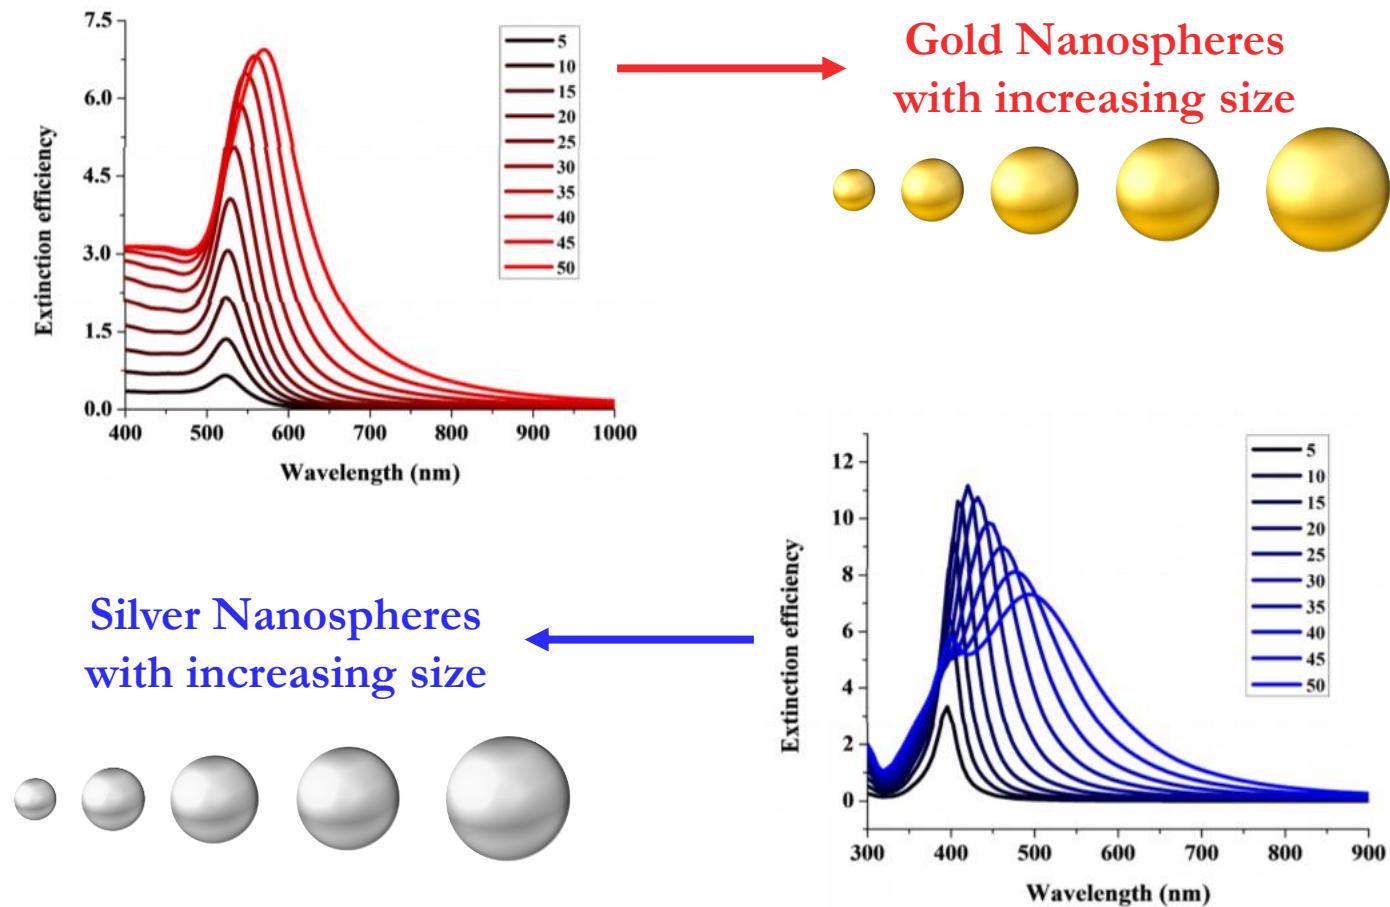

- Localized Surface Plasmon Resonance and Metal-Enhanced Fluorescence
- Plasmonic Hydrogels: Design and Optical Characterization
- Dual-Sensing of Streptavidin in PEGDA 10kDa as a Proof of Concept
- Conclusions and Future Perspectives

# Outline

- Plasmonic Hydrogels: Design and Optical Characterization
- Dual-Sensing of Streptavidin in PEGDA 10kDa as a Proof of Concept
- Conclusions and Future Perspectives

# Introduction: LSP Resonance

- *Plasmon*: oscillation of electron density with respect to the fixed positive ions in a metal.
- **Localized surface plasmon resonance (LSPR)**: a size and shape-dependent coherent oscillation of the conduction electrons of a noble metal nanoparticle ( $d \ll \lambda$ ).
- LSPRs exhibit strong field enhancement in the surroundings of the nanoparticles, which makes their resonance locally sensitive to refractive index variations.

Farooq, S. and de Araujo, R.E, Open Journal of Applied Sciences, 2018.

# Introduction: Metal-Enhanced Fluorescence

- *Metal-Enhanced Fluorescence* is a phenomenon dependent on:
  - the spectral overlap between a fluorescent dye and the plasmon absorbance
  - the fluorophore-nanostructure distance  $z$ .
- Förster resonance energy transfer (FRET) mechanism
- Purcell effect mechanism
- Dual-mechanism

# Introduction: Flexible Plasmonic Nanocomposites

**“Flexible Plasmonic Nanocomposites”:** plasmonic nanoparticles impregnated over/in flexible solid substrates.

## **Advantages:**

- ✓ Cost-Effectiveness
- ✓ High Processability
- ✓ Adaptable to non-planar substrates
- ✓ *In-situ / In-vivo* collection of the samples
- ✓ Easy integration into more complex systems

- Dual-Sensing of Streptavidin in PEGDA 10kDa as a Proof of Concept
- Conclusions and Future Perspectives

# Plasmonic Hydrogels: Fabrication

## Hydrogels for miniaturized 3D biosensors

- ✓ Biorecognition elements are adhered onto a 3D architecture

### Polyethylene glycol diacrylate (PEGDA)

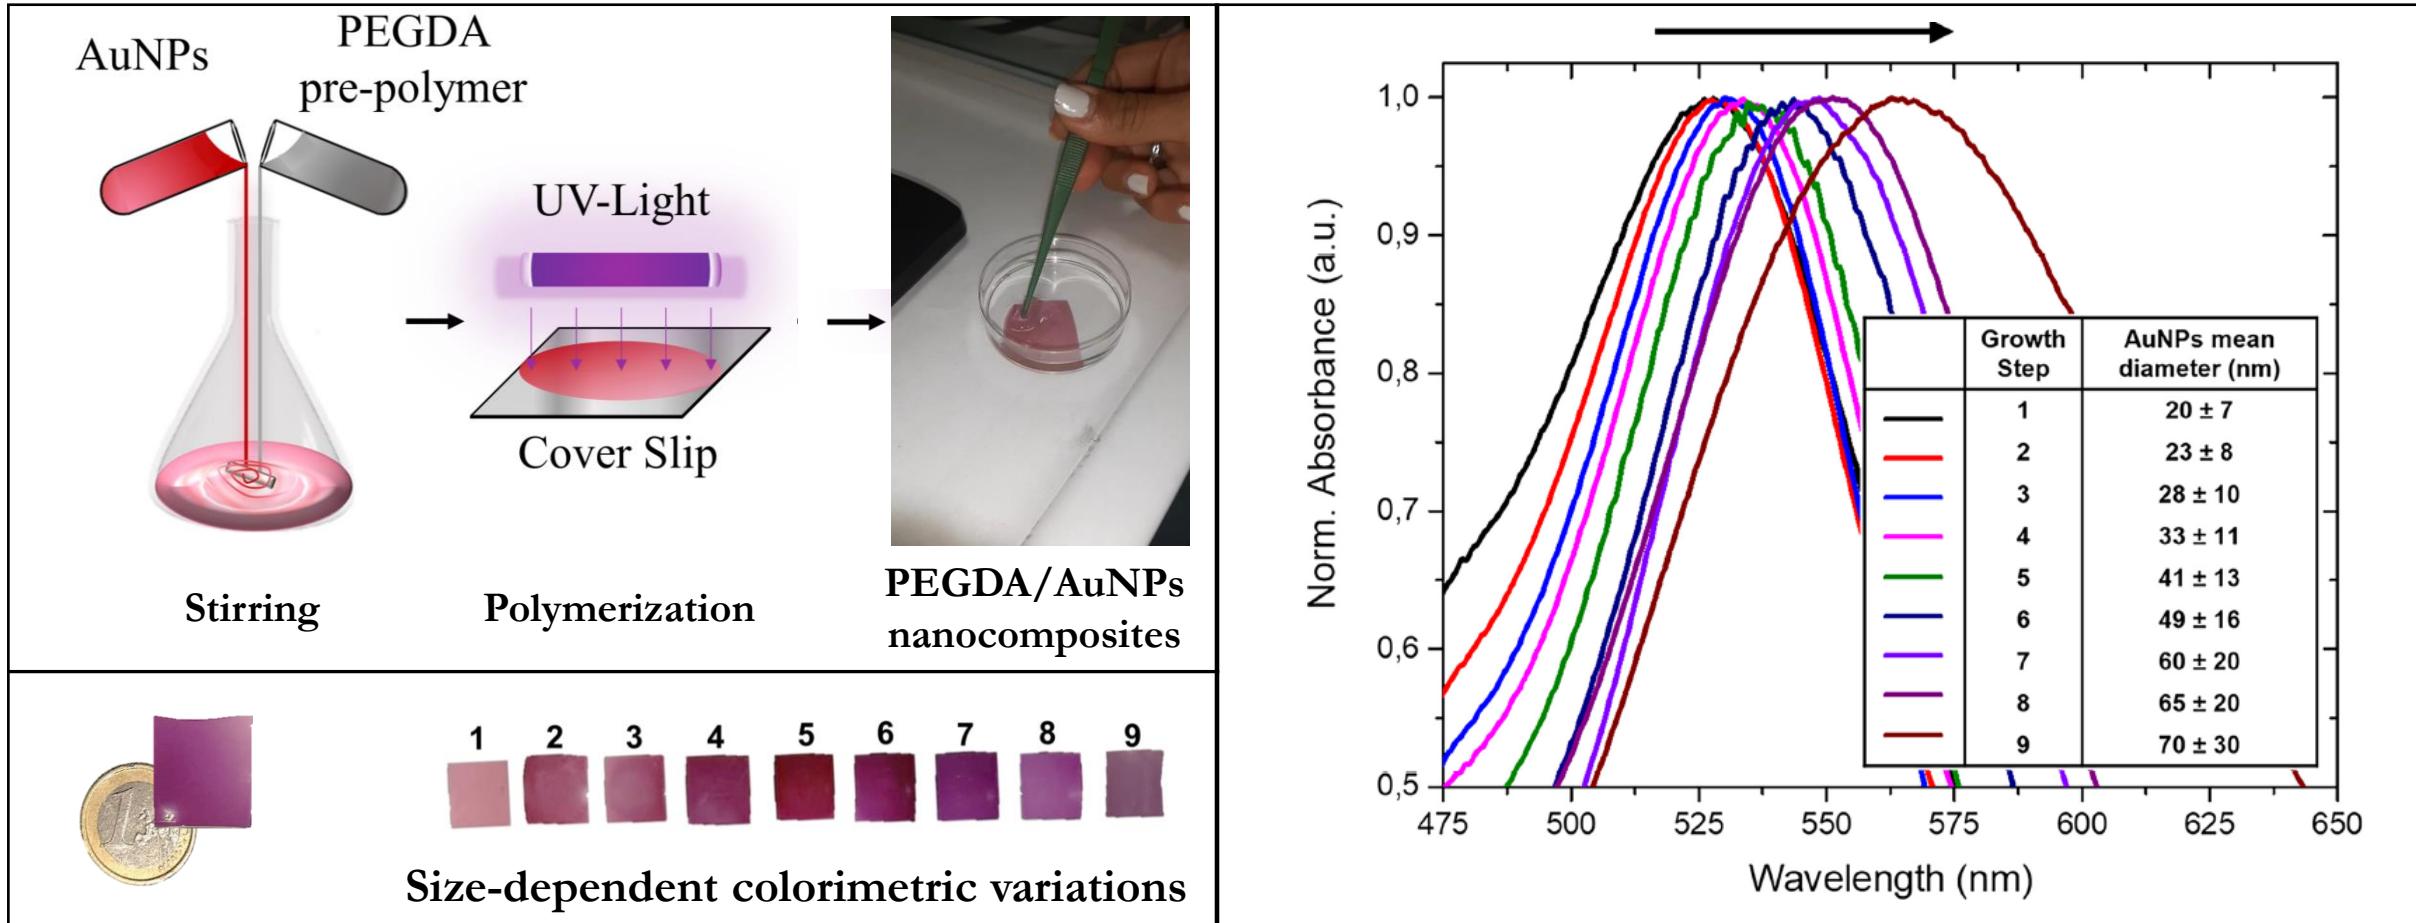

- ✓ Excellent matrices for the entrapment of biomolecules
- ✓ Non-fouling material (useful for complex solutions)
- ✓ Tunable micropatterning with photolithographic techniques.
- ✓ Tunable network in terms of mesh size and crosslinking

### Colloidal citrate gold nanoparticles (Au-NPs)

- ✓ Tunable in size and shape
- ✓ Many surface chemistry protocols have been optimized

# Plasmonic Hydrogels: Functionalization

LSPR measurements are used to monitor the functionalization steps.

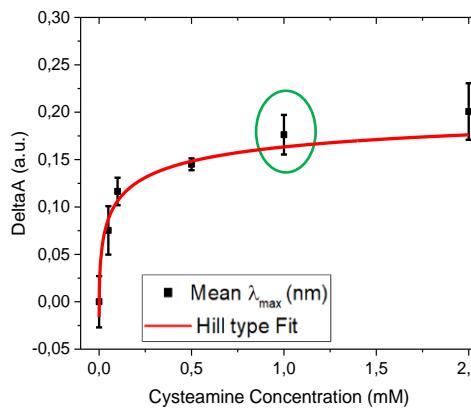

A Bio-responsive hydrogel is obtained by functionalizing gold nanoparticles within the hydrogel with a biorecognition element.

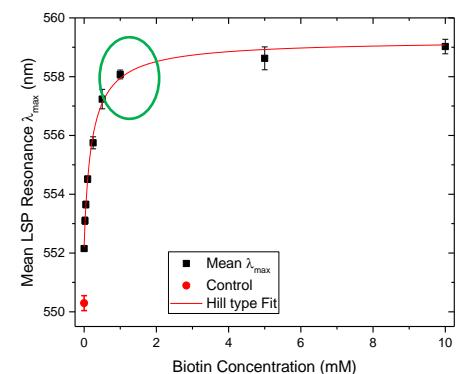

PEGDA700

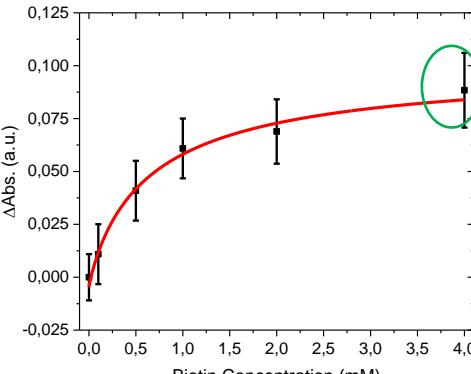

PEGDA10kDa

PEGDA700

- Plasmonic Hydrogels: Design and Optical Characterization
- **Dual-Sensing of Streptavidin in PEGDA 10kDa as a Proof of Concept**
- Conclusions and Future Perspectives

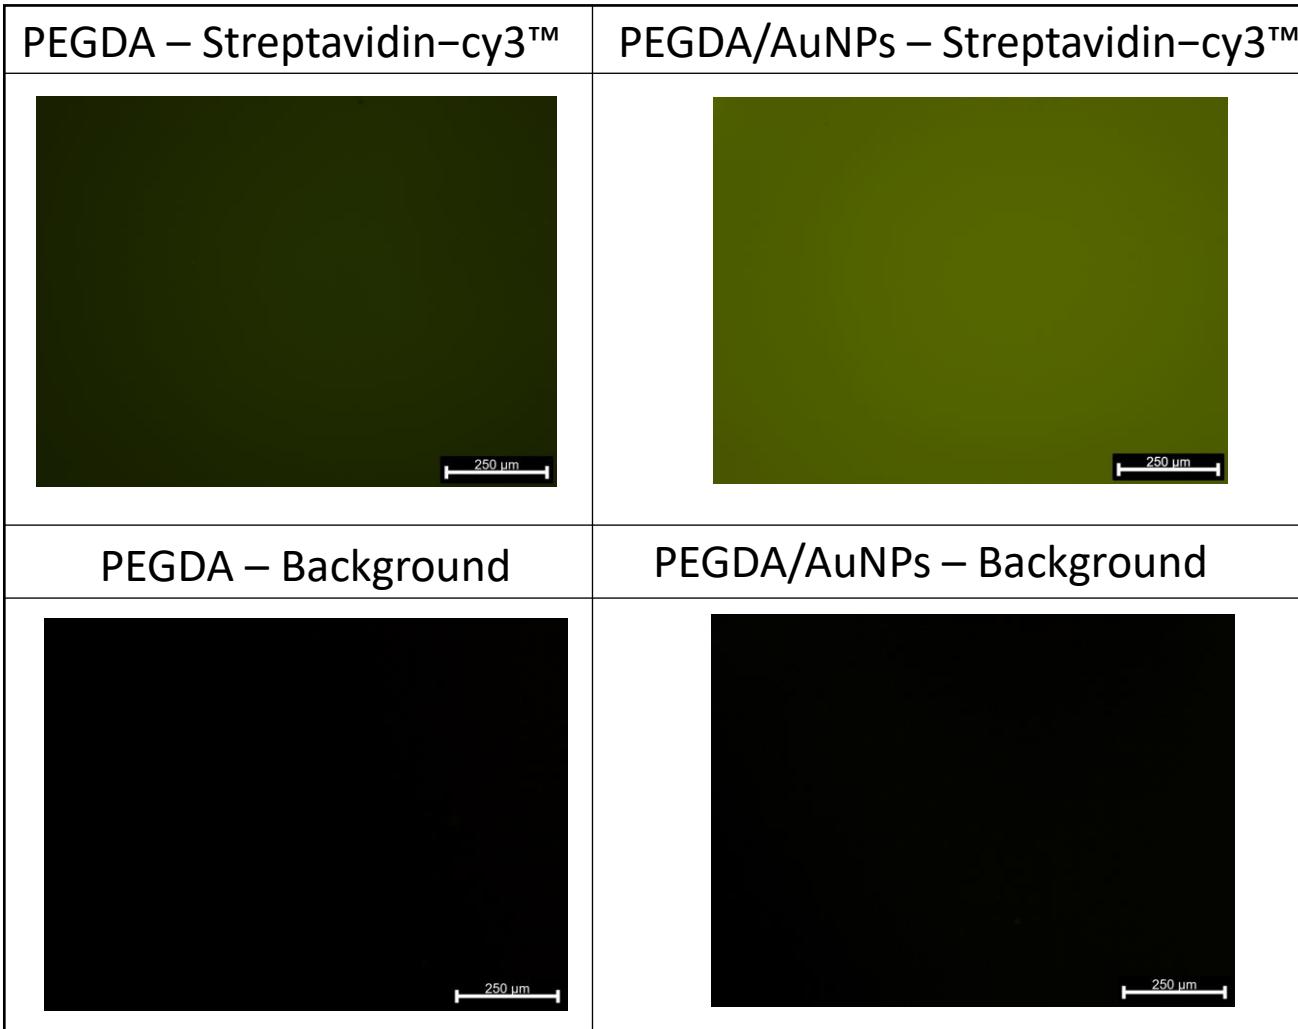

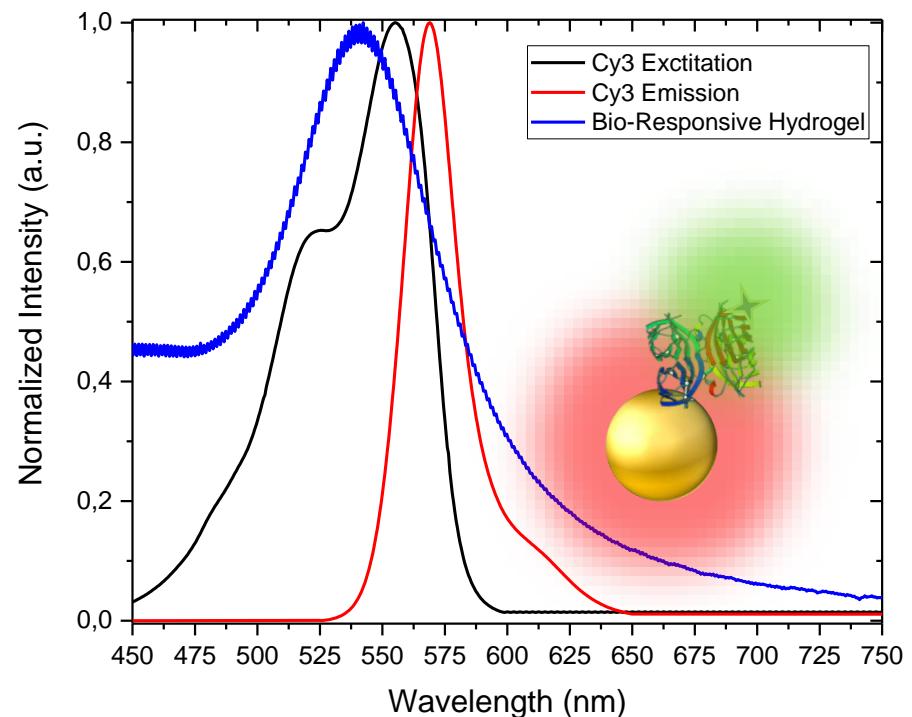

# LSPR sensing of Streptavidin

Streptavidin was incubated in PEGDA/AuNPs nanocomposites in the same conditions to evaluate plasmon decoupling as a function of the target concentration.

# Fluorescence-Enhancement Evaluation

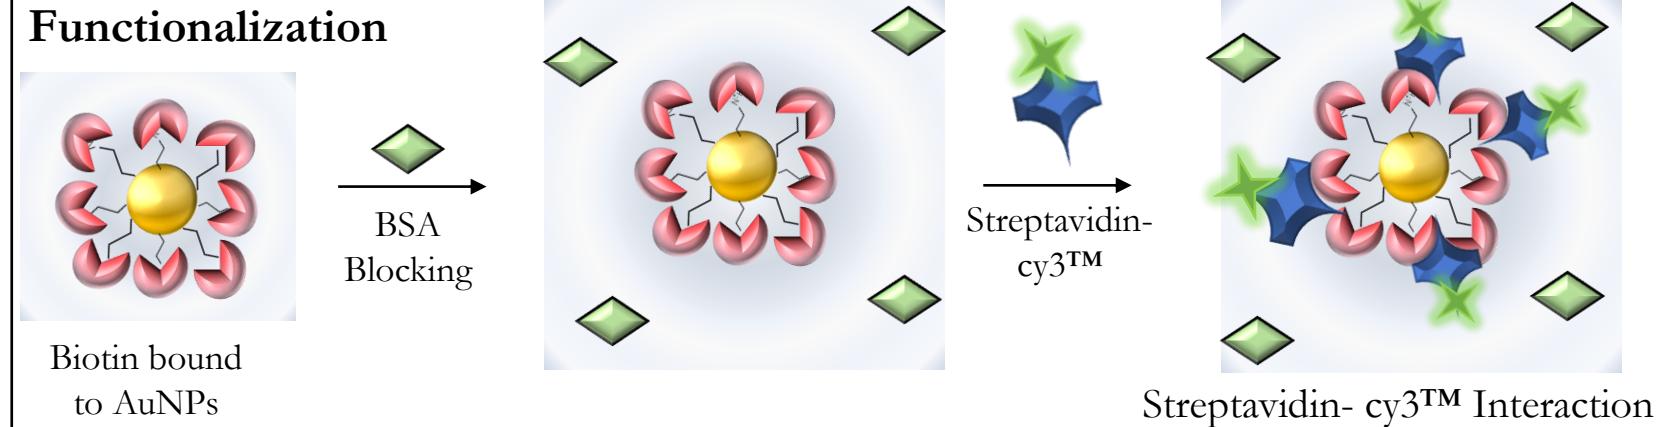

Fluorescent Streptavidin-cy3<sup>TM</sup> (100 nM) was incubated in PEGDA hydrogels and PEGDA/AuNPs nanocomposites in the same conditions to allow the computation of the Fluorescence Enhancement (FE).

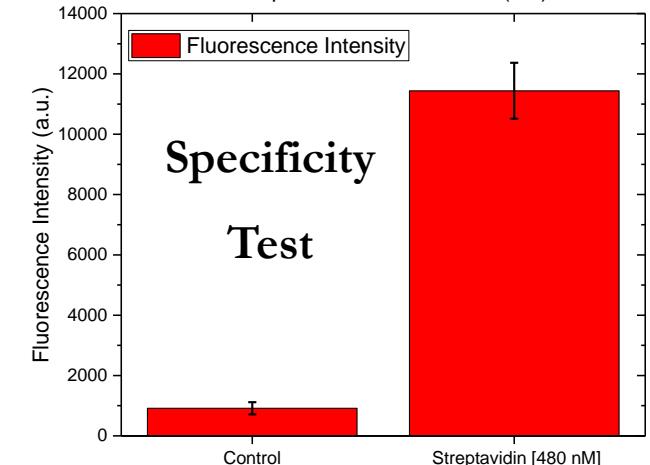

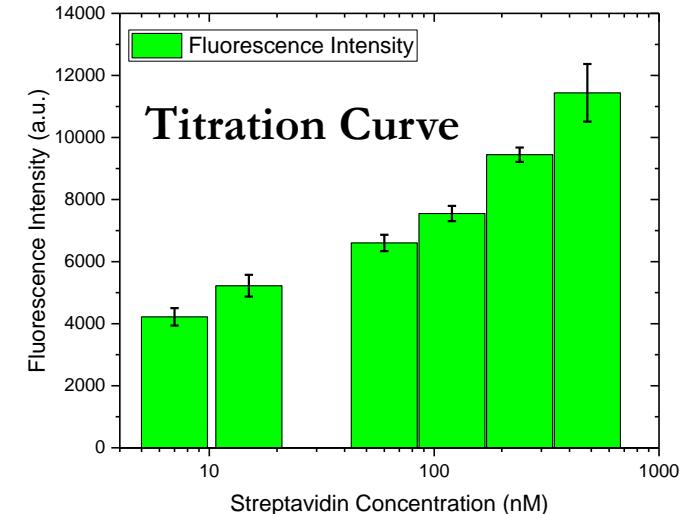

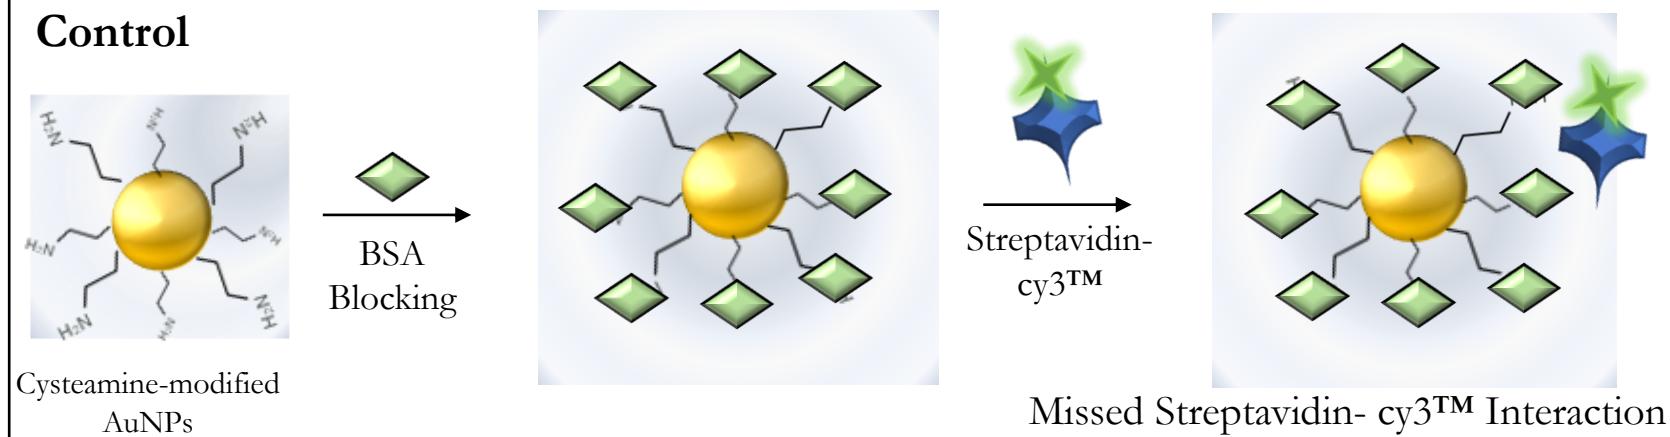

# 3D MEF Biosensor: Streptavidin Sensing

Bio-responsive PEGDA/AuNPs nanocomposites functionalized with Biotin with Streptavidin- cy3<sup>TM</sup>.

## Functionalization

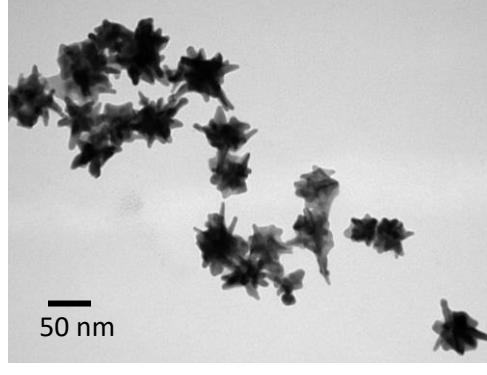

## Control
