INTRODUCTION

Type 2 Diabetes Mellitus (T2DM) is closely related to cognitive impairment and dementia.

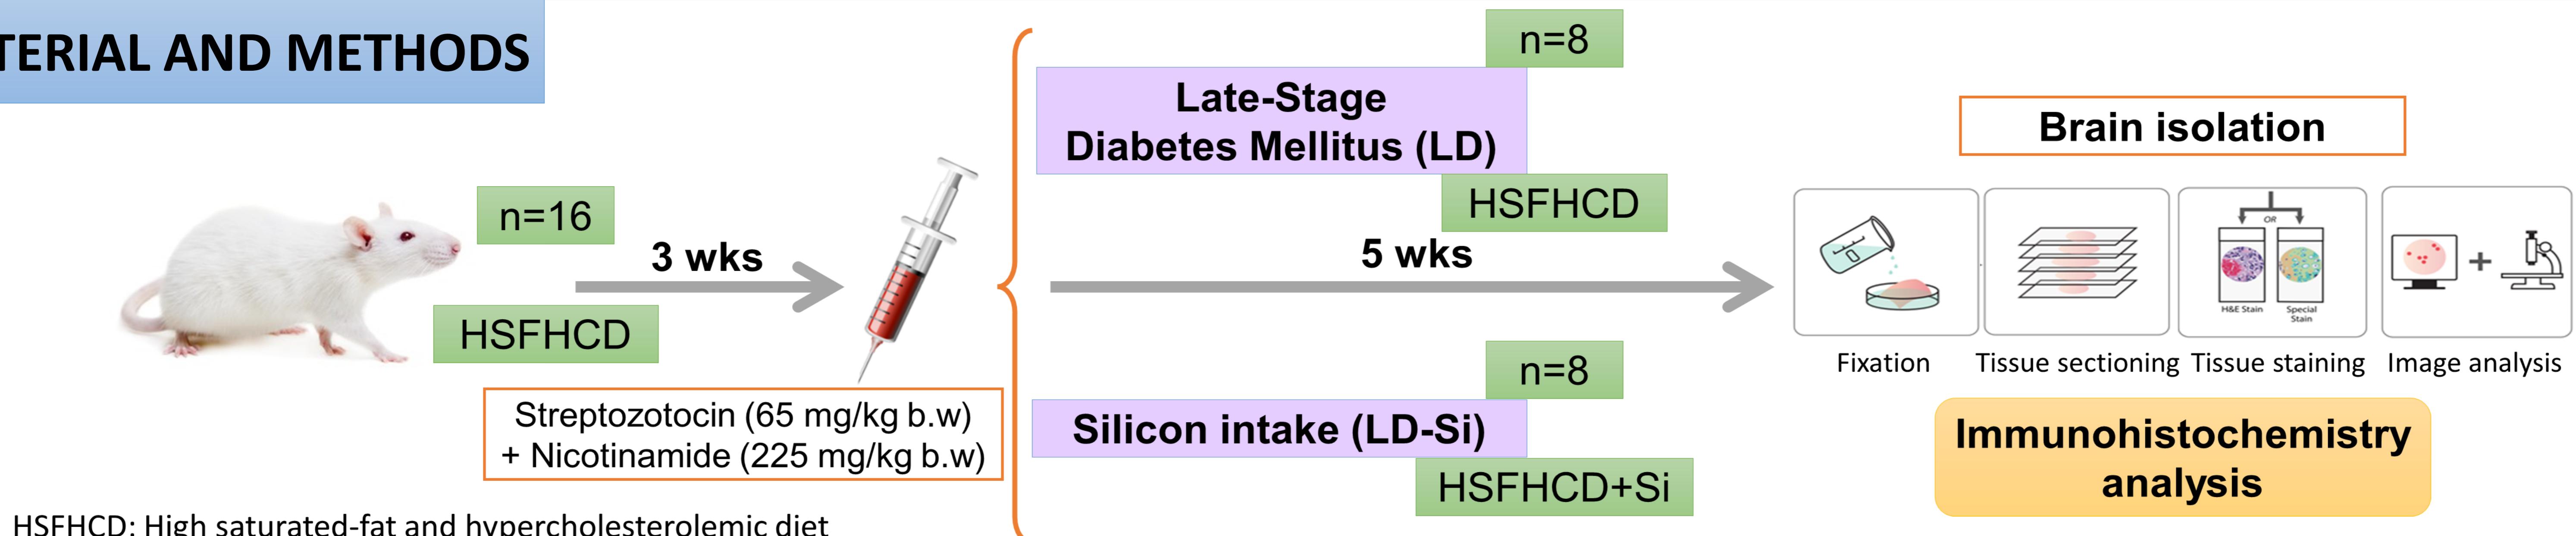

Inflammatory response, which occurs mainly through NF-κB pathway in T2DM, may contribute to the brain dysfunction.

Silicon has antidiabetic, antioxidant, and anti-inflammatory properties; however, its effects on the inflammatory responses in the brain of T2DM rats are unclear.

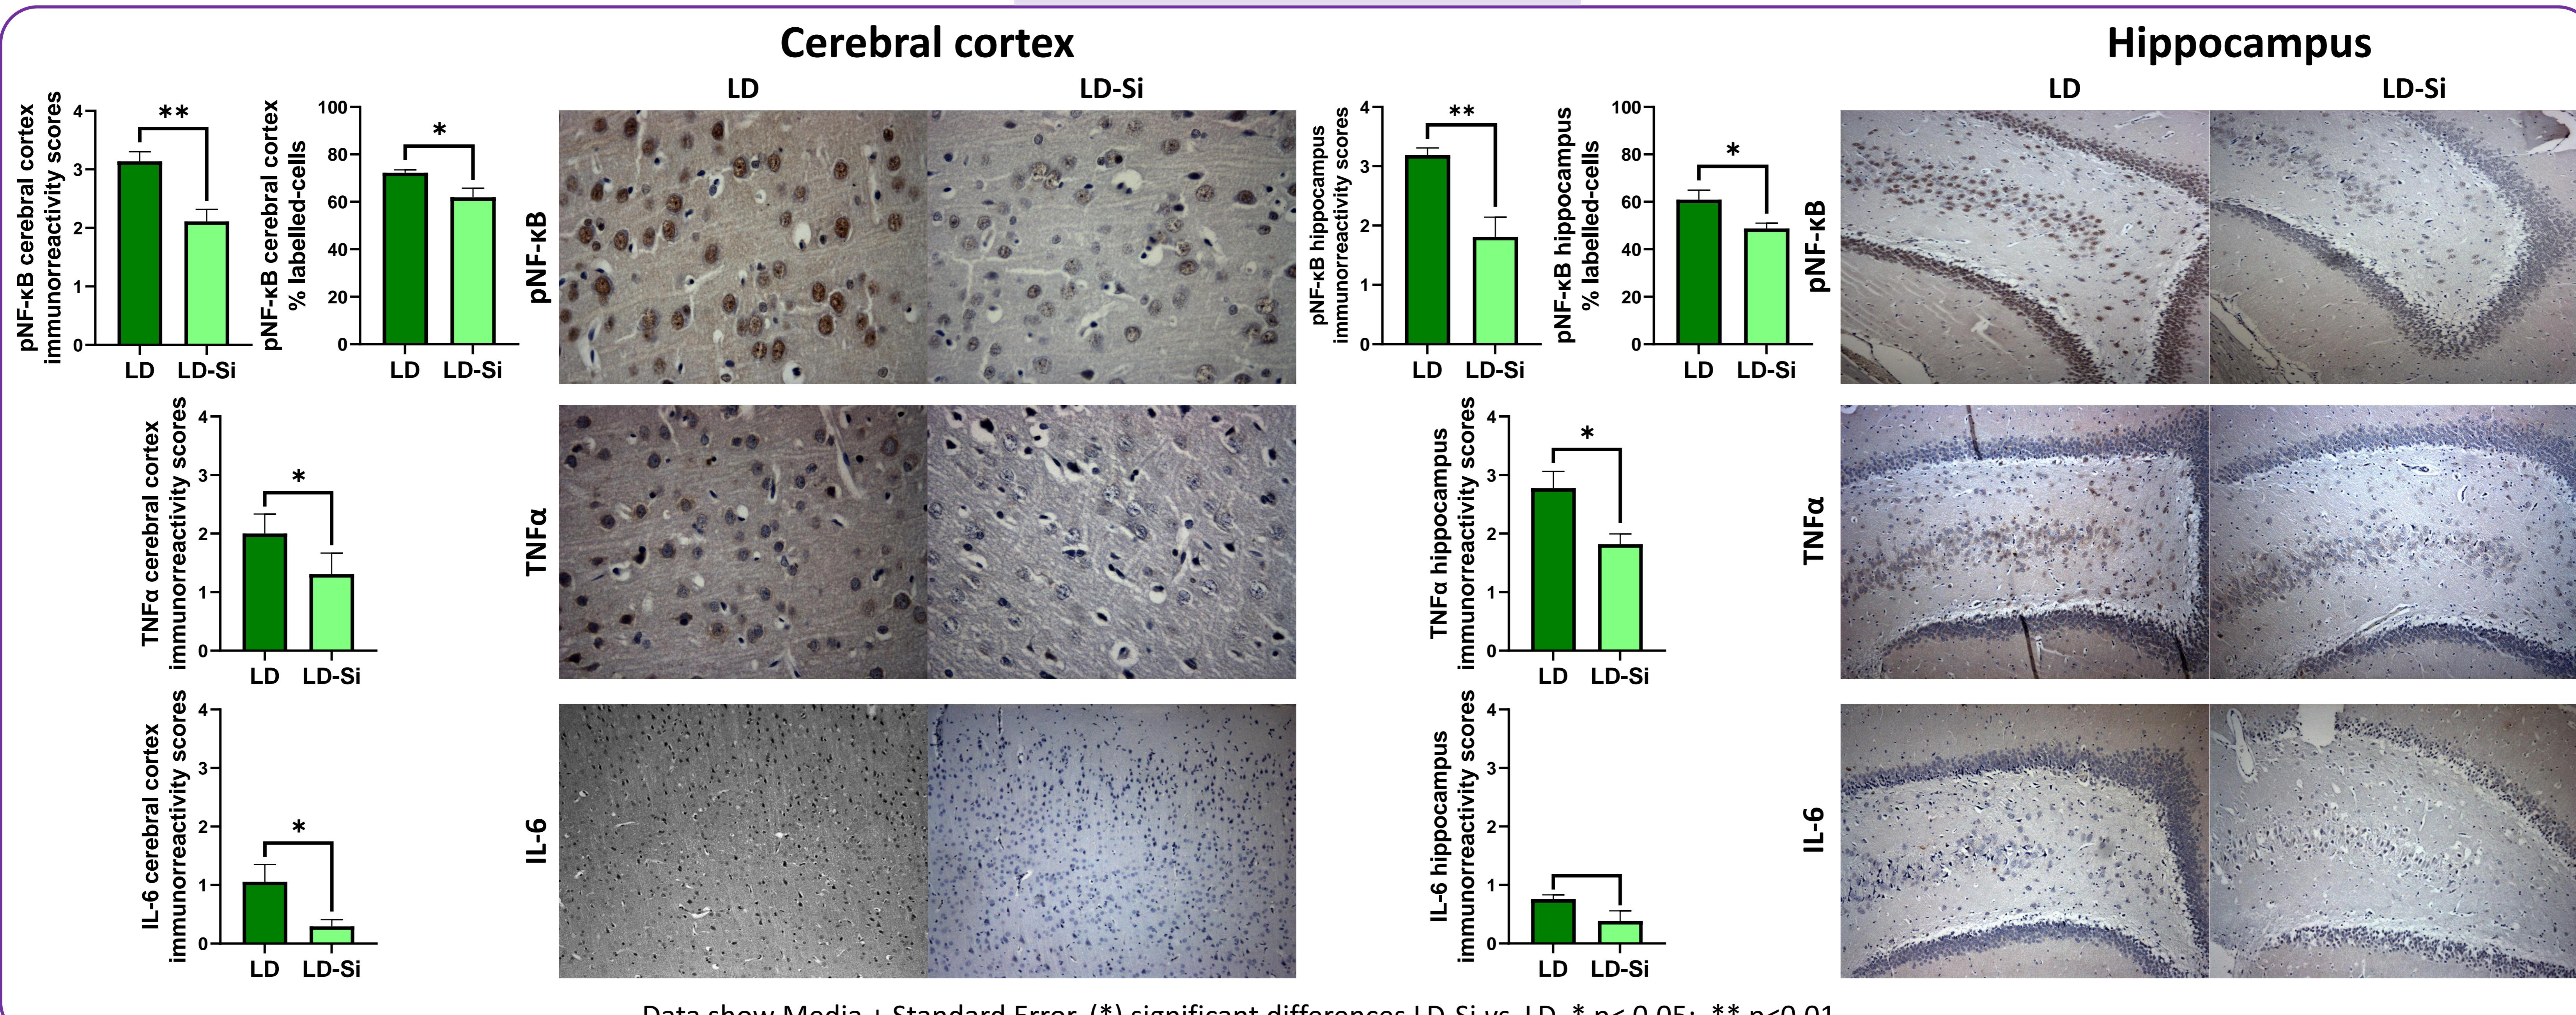

OBJECTIVE

To evaluate the **anti-inflammatory effect of silicon in the cerebral cortex and hippocampus of late-stage T2DM rats.**

MATERIAL AND METHODS

RESULTS

CONCLUSIONS

- ❖ Silicon is able to decrease the NF-κB pro-inflammatory pathway in cortex and hippocampus of late-stage T2DM rats.
- ❖ Silicon administration as a functional ingredient may offer a novel nutritional strategy in neuroprotection of T2DM-associated cognitive impairment.
