INTRODUCTION & AIM

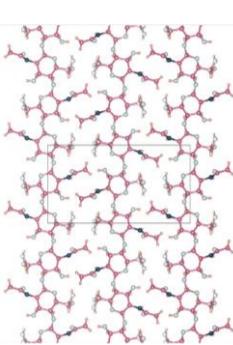

Black titania (BT)

- Black TiO_2
- Structural modifications (Oxygen vacancies/ Ti^{3+} ions) on the surface
- Change in the electronic structure and band gap (1.2-1.7 eV)

Cellulose and Chitin Nanocrystals (CNCs, ChNC)

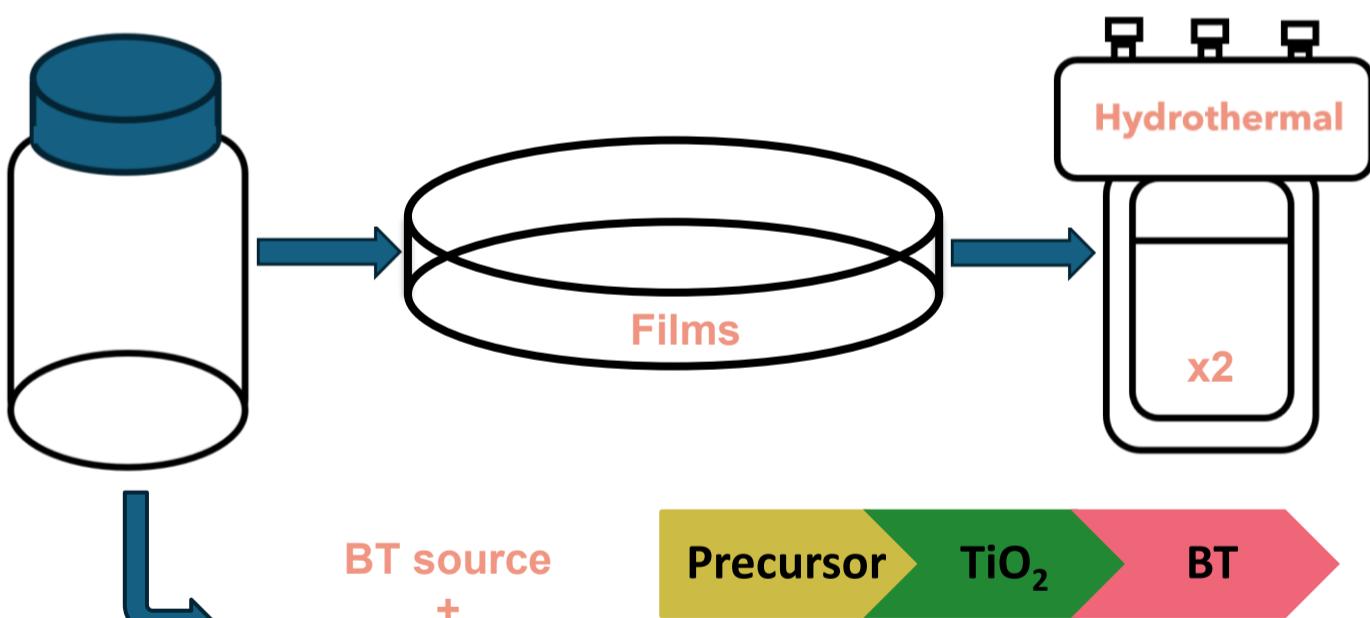

- Cellulose and chitin: First and second most abundant biopolymers on Earth
- Cellulose: Plants
- Chitin: shells of crustaceans and the cell walls of fungi

Composites

- BT: electronic properties + disordered structure
- CNCs/ChNC: matrix/support, low density, renewability, and biodegradability
- Applications in supercapacitors: **Electrical double-layer capacitors (EDLC)**

METHOD

Samples
ChNC

- Ch3_BT
- Ch4_BT

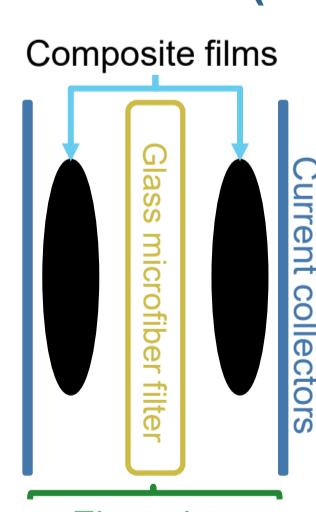

ChNC + glucose

- Ch3_Gluc_1C
- Ch3_Gluc_1V

ChNC + CNCs

- Ch3_CNCs
- Ch3_2_CNCs

Electrochemical measurements (EDLC):

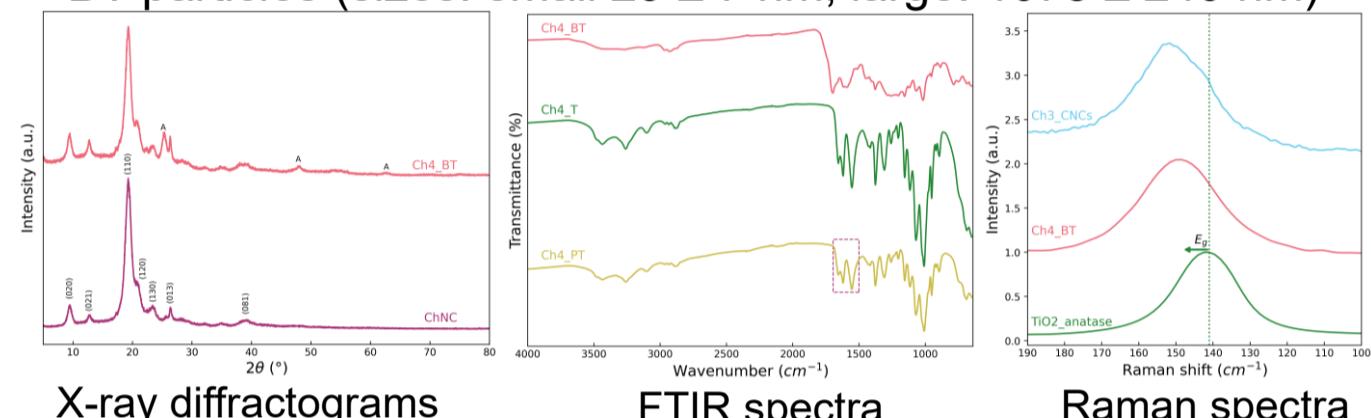

Acknowledgments

- MacLachlan group (UBC)
- Dan Bizzoto (UBC)
- Derrick Horne (BIF-UBC)
- Ben Herring (SIF-UBC)
- YiTao Xu (UBC)
- Mario Gonzalez (UBC)

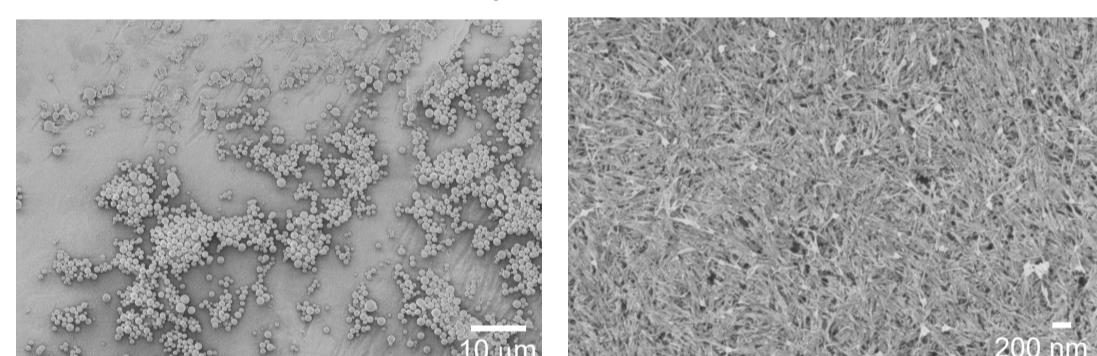

RESULTS & DISCUSSION

Characterization of the composite films

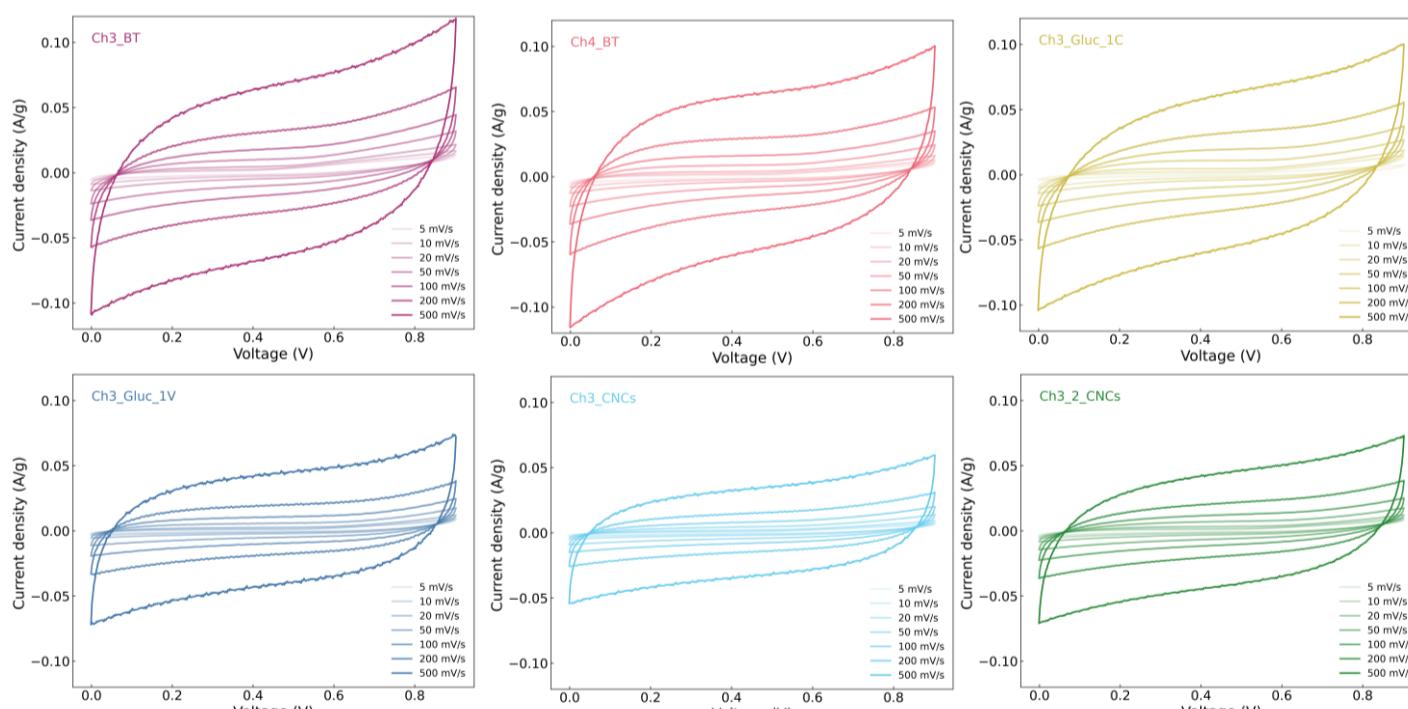

- BT: anatase \rightarrow 23 nm. ChNC: preferred orientation (110)
- Hydrothermal carbonization of ChNC/CNCs/glucose
- Raman spectroscopy: E_g Raman mode blue-shifted \rightarrow confirmation of black titania
- All samples - same morphology: ChNC/CNCs/glucose matrix + BT particles (sizes: small 29 ± 7 nm, large: 1078 ± 240 nm)

SEM – representative sample (Ch4_BT)

Cyclic voltammograms: Scan rates

CVs: the squarer and more symmetrical, the better. Improvement with higher scan rates (all samples). Variation with ChNC/CNCs/Glucose precursor content

CONCLUSIONS + FUTURE WORK

- Synthesis, optimization, and characterization of black titania and biopolymers composite films for energy-storage applications
- Confirmation of black titania and carbonization of biopolymer source. Similar morphology for all of the samples
- Supercapacitors applications. Better performance with higher scan rates.
- Future work: explore the effect of different electrolytes
