

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018

AUTONOMOUS DAMAGE DETECTION IN DOUBLE TRACK STEEL RAILWAY BRIDGES

Ahmed Rageh

Ph.D. Student, Civil Engineering, University of Nebraska-Lincoln

Saeed Eftekhar Azam, Ph.D.

Postdoctoral Scholar, Civil Engineering, University of Nebraska-Lincoln

Daniel Linzell, Ph.D., P.E.

Voelte-Keegan Professor and Department Chair, Civil Engineering, University of Nebraska-Lincoln

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018

• Outline

- ✓ Damage detection under nonstationary, unknown inputs
- ✓ Why Proper Orthogonal Modes as damage feature?
- ✓ Why ANNs for damage detection?
- ✓ Bridge description
- ✓ Train loads measured by Weigh in Motion sensors
- ✓ Stringer-to-floor beam connection damage detection

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018

- **Conventional approach to vibration based damage identification:**

1. Model construction: intact baseline model
2. Modal identification: typically OMA
3. Model updating
4. Damage identification

- **Challenges:**

1. Modal identification: unknown, non-stationary excitations: train load
2. Model updating: curse of dimensionality for high number of unknowns
3. Modal identification and model updating: Measurement noise

- **Our approach:**

1. Construct a model
2. Measure a set of non-stationary loads
3. Find features in response that has correlation to non-stationary loads
4. Use proper orthogonal modes of measured response as damage features
5. Train an ANN:
 - I. use few train loads and the model to train the network; and
 - II. the trained network will generalize for response to unknown future loads

- **Work done:**

1. Detailed FE model of the bridge was constructed
2. Axles loads were measured for 81 trains
3. ANNs were trained
4. ANNs were tested for generalization to unknown loads

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018

- **Why proper orthogonal modes?**

1. Could be calculated automatically
2. Robust to measurement noises
3. Easy to interpret

- **Why ANNs:**

1. Extract subtle changes from changes in damage features
2. Robust to curse of dimensionality
3. Need for minimal user training
4. Generalize well for unknown inputs

- **Bridge description** [Owner plans, reports]

- ✓ Double track
- ✓ Riveted construction
- ✓ Pin and eyebar

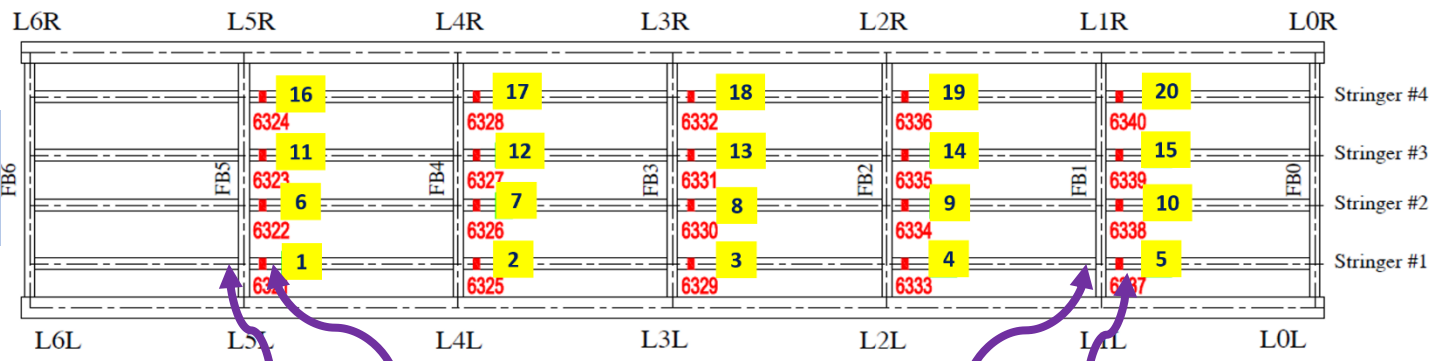

- **Stringer-to-floor beam connection damage detection – Analytical based**

- MATLAB code
- Reads train loading excel files
- Model trains in SAP2000
- Extracts and stores strains
- 81 trains to the west, one track, 50 axles/train

- Stringer-to-floor beam connection damage detection – Analytical based

Stress time-history @ marked locations

One sensor capture damage on both sides

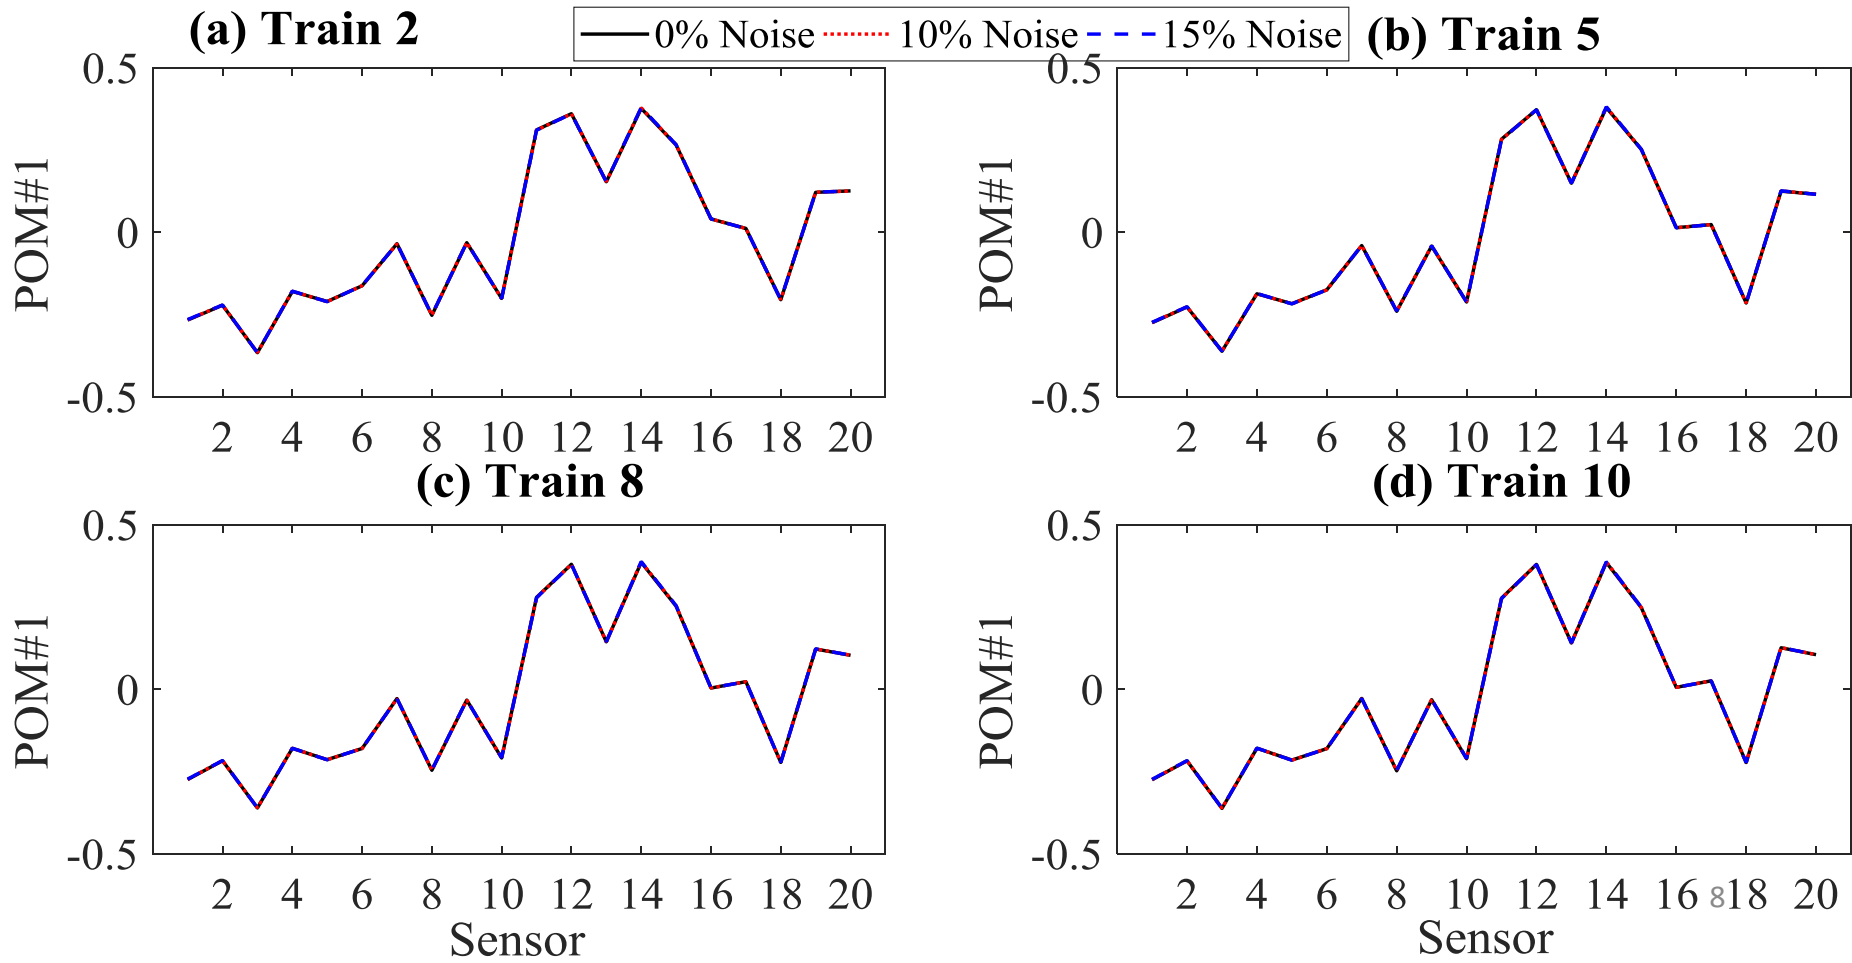

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018

- POMs of 4 train loads for various noise to signal ratio levels:

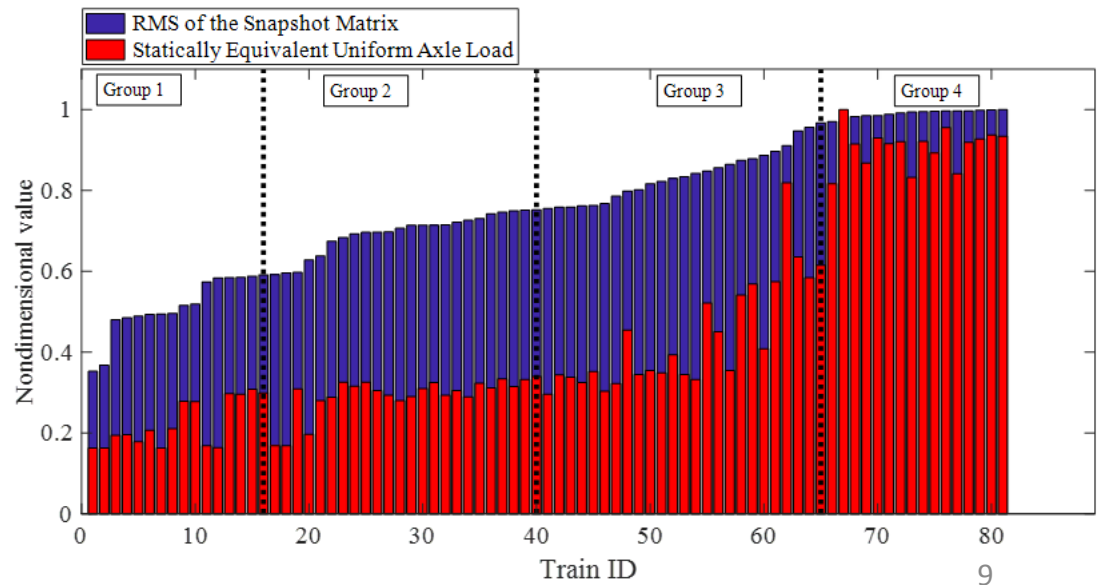

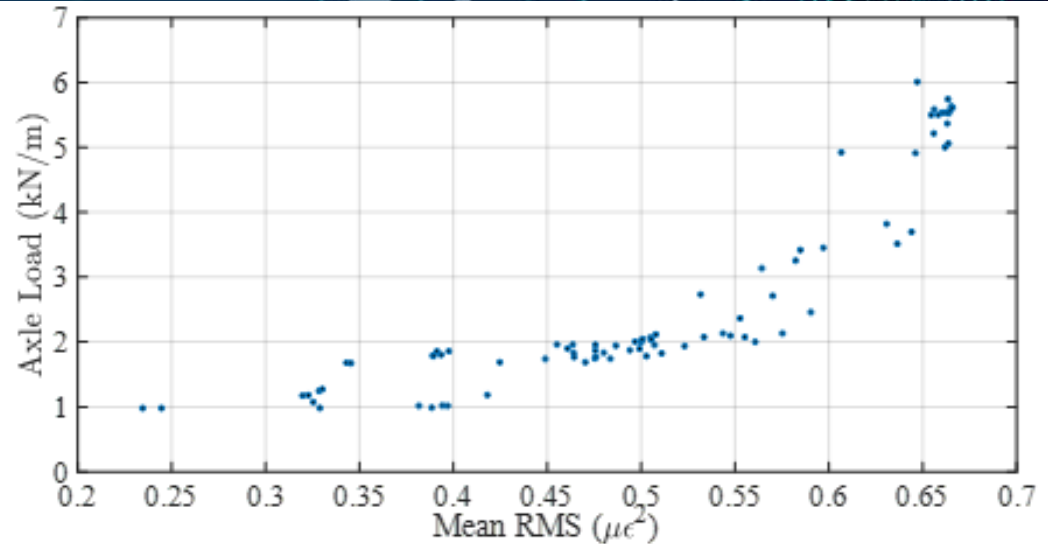

• How to treat unknown inputs?

1. Find features of response which are correlated with loads
2. Train a clustering/classification algorithm

• What we did:

1. Measured train axle loads using Weigh in Motion (WIM)
2. Used the measured axle loads to calculate the structural response
3. Compared response from the model to find a correlation between response features and axle loads
4. **Mean RMS of channels is the feature**

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018

- **POMs of each of 4 groups vs all POMs together:**

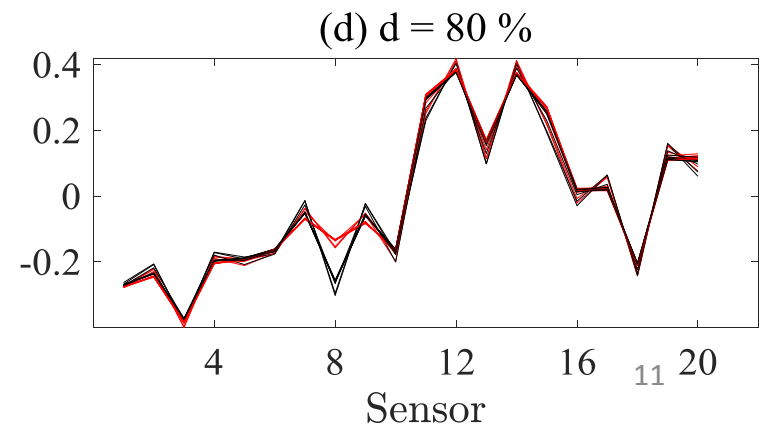

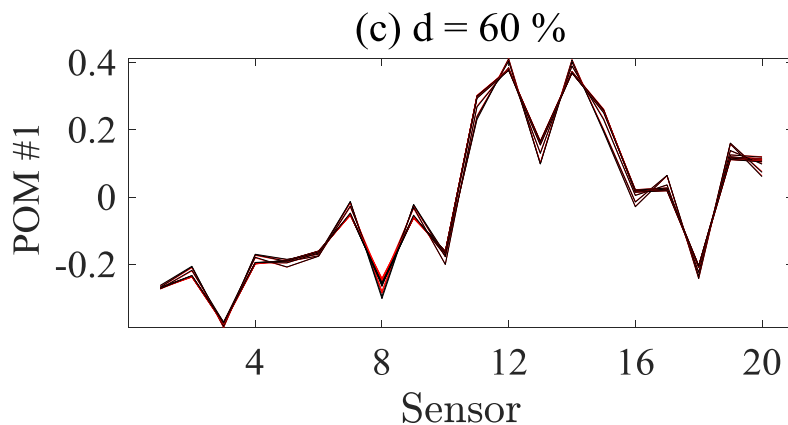

1. You notice categorizing POMS based on RMS values reduces variability
2. We used POMs of Group 4 for ANN training

• POMs of Group 4 and various damage levels:

1. The higher the damage level, the more pronounced the variation in POM
2. Smaller damage levels not detectable: there is still discrepancy stemming from load variations

3. We used ANNs to detect small damage levels

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018

- **Stringer-to-floor beam connection damage detection – Analytical based**
 - ✓ **POMs influenced by:**
 - **Loads**
 - Environmental effects (future work)
 - **Damage**
 - ✓ **ANNs:**
 - **Half** of trains in Group 4 were used for training
 - **Half** of trains in Group 4 were used for testing (successful)
 - Trains from Group 1, 2, and 3 yielded bad results

- Stringer-to-floor beam connection damage detection – Analytical based

POMs

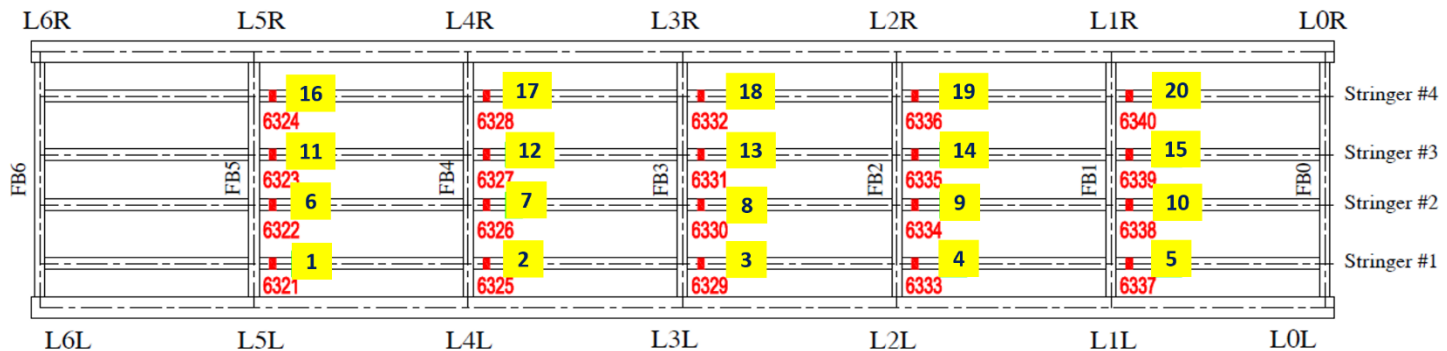

Damage/load scenarios

Damage location/intensity

Bending stiffness reduction of: 10:10:100%

200 damage scenarios/train

- ✓ **In total we measured 81 train loads**
 - The trains were categorized, and divided into 4 groups
 - We trained ANN using 6 train loads, all from Group 4
 - We test ANN using 4 trains, from Group 4

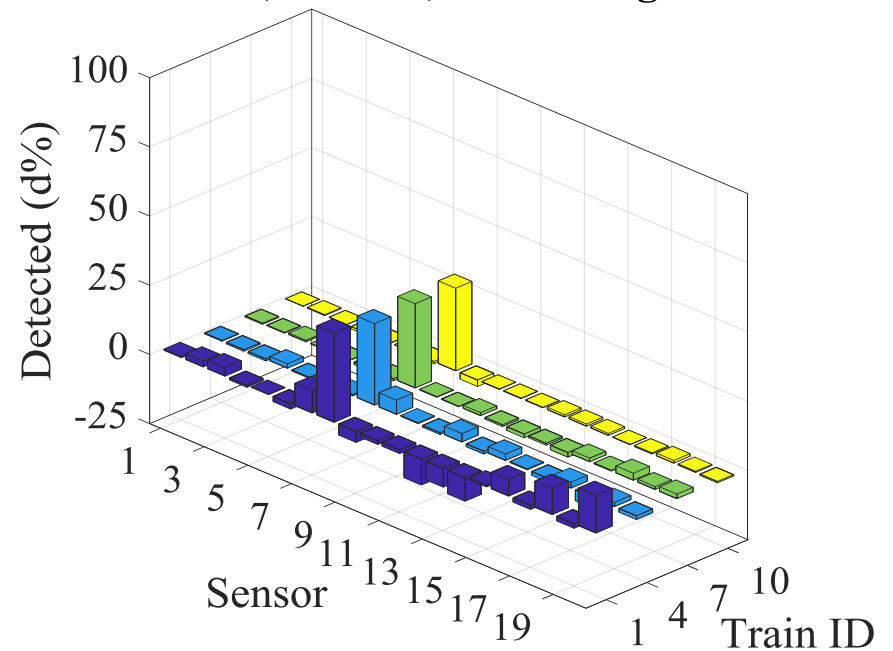

- Stringer-to-floor beam connection damage detection
- **6 trains used in ANN training**
- **The testing trains were not used in ANN training**

Sensor 17, d=80%, All Testing Train

Sensor 8, d=30%, All Testing Trains

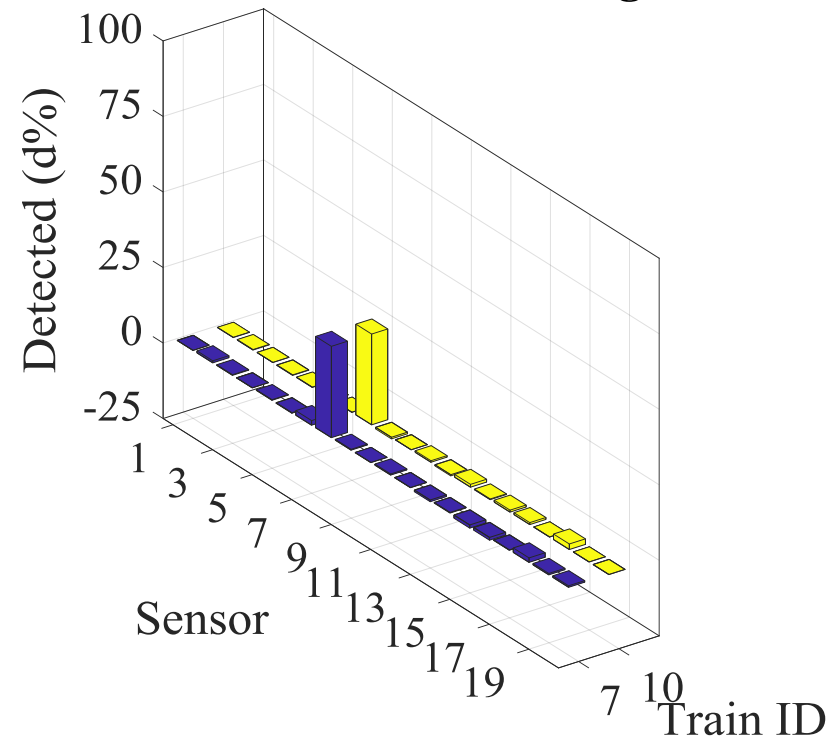

- Stringer-to-floor beam connection damage detection
- **8 trains used in ANN training**
- **The testing trains were not used in ANN training**

Sensor 17, d=80%, All Testing Trains

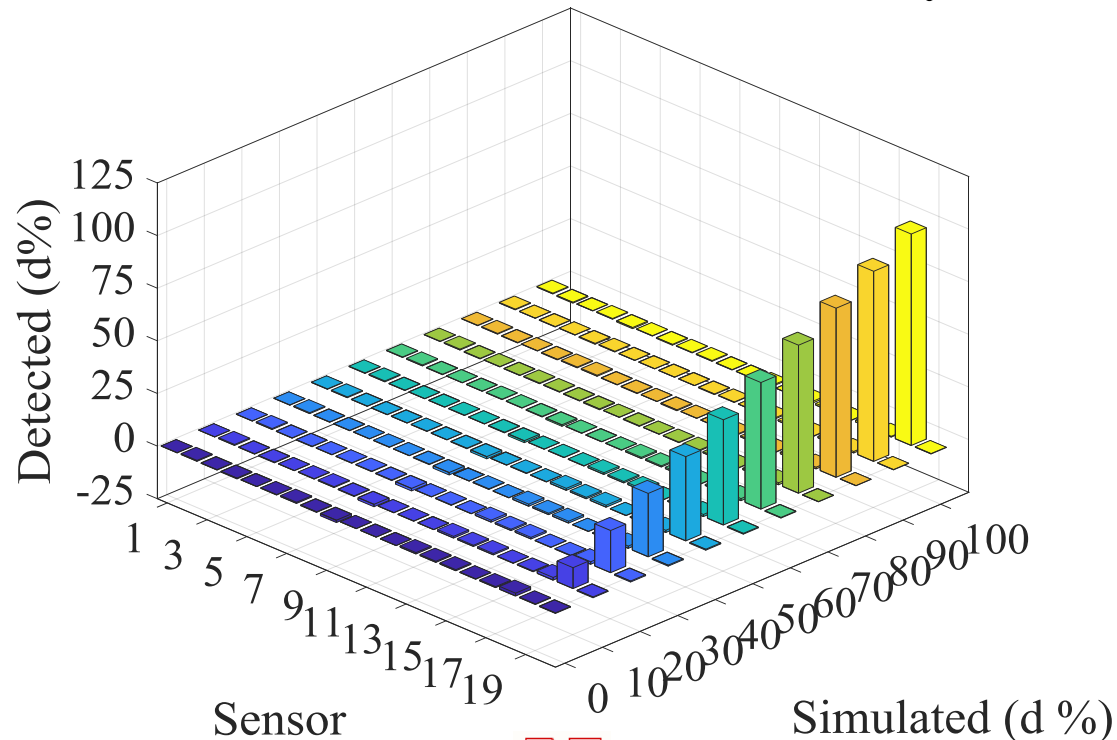

Sensor 8, d=30%, All Testing Trains

- Stringer-to-floor beam connection damage detection
- **6 trains used in ANN training**
- **The testing trains were not used in ANN training**

Train 10, Location 19, All d, ANN Trained by 6 Trains

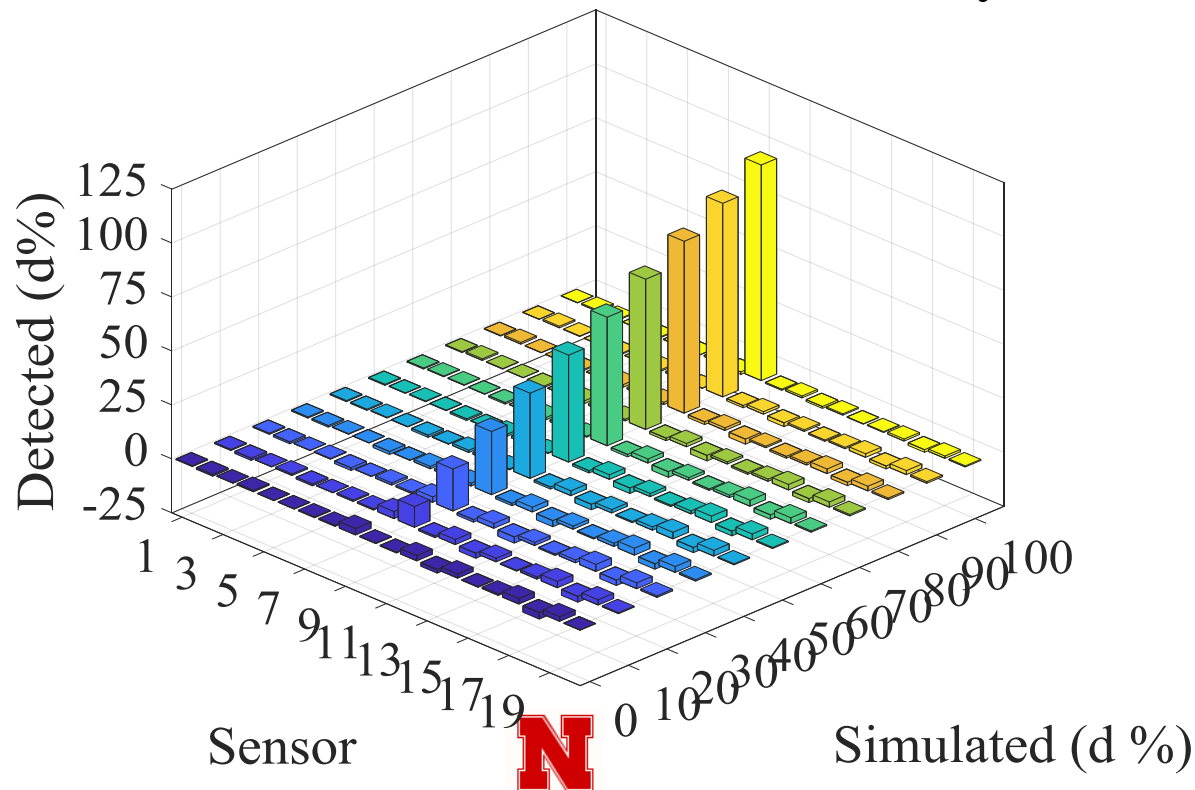

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018

- Stringer-to-floor beam connection damage detection
- **6 trains used in ANN training**
- **The testing trains were not used in ANN training**

Train 4, Location 10, All d, ANN Trained by 6 Trains

- Stringer-to-floor beam connection damage detection
- The testing trains were not used in ANN training

(a) Train 66, Group 4, $d = 0\%$

(b) Train 70, Group 4, $d = 0\%$

(c) Train 74, Group 4, $d = 0\%$

(d) Train 78, Group 4, $d = 0\%$

- What if the testing trains are selected from other groups?
- The testing trains were not used in ANN training

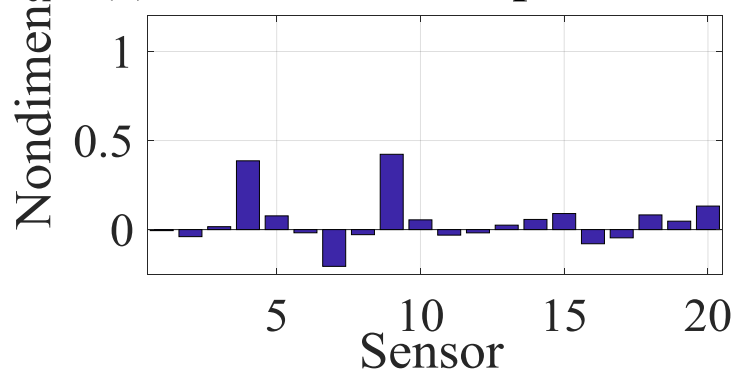

(a) Train 41, Group 3, $d = 0\%$

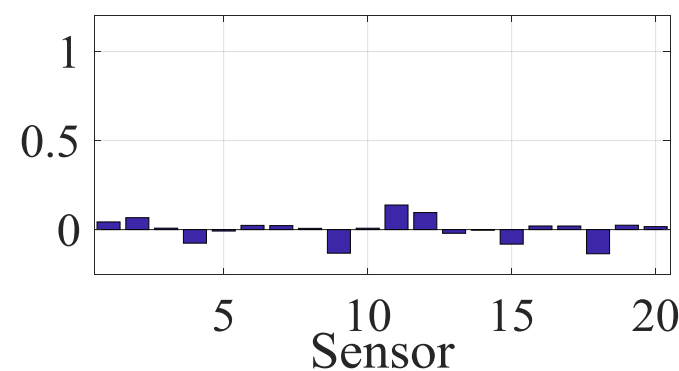

(b) Train 47, Group 3, $d = 0\%$

(c) Train 53, Group 3, $d = 0\%$

(d) Train 59, Group 3, $d = 0\%$

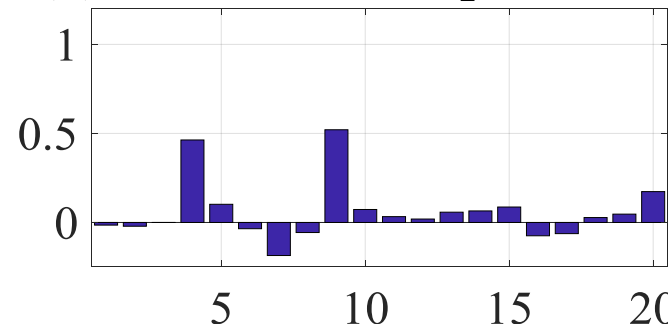

- What if the testing trains are selected from other groups?
- The testing trains were not used in ANN training

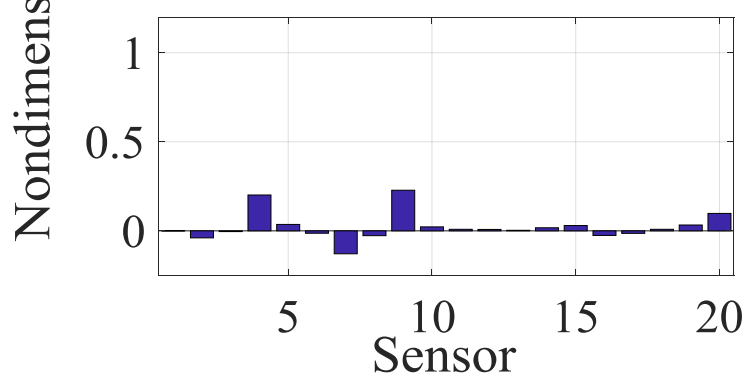

(a) Train 17, Group 2, $d = 0\%$

(b) Train 23, Group 2, $d = 0\%$

(c) Train 29, Group 2, $d = 0\%$

(d) Train 35, Group 2, $d = 0\%$

- What if the testing trains are selected from other groups?
- The testing trains were not used in ANN training

(a) Train 1, Group 1, $d = 0\%$

(b) Train 5, Group 1, $d = 0\%$

(c) Train 9, Group 1, $d = 0\%$

(d) Train 13, Group 1, $d = 0\%$

- What if the testing trains are selected from other groups?
- The testing trains were not used in ANN training

(a) Train 1, Group 1, $d = 0\%$

(b) Train 5, Group 1, $d = 0\%$

(c) Train 9, Group 1, $d = 0\%$

(d) Train 13, Group 1, $d = 0\%$

- **Stringer-to-floor beam connection damage detection – Field based**

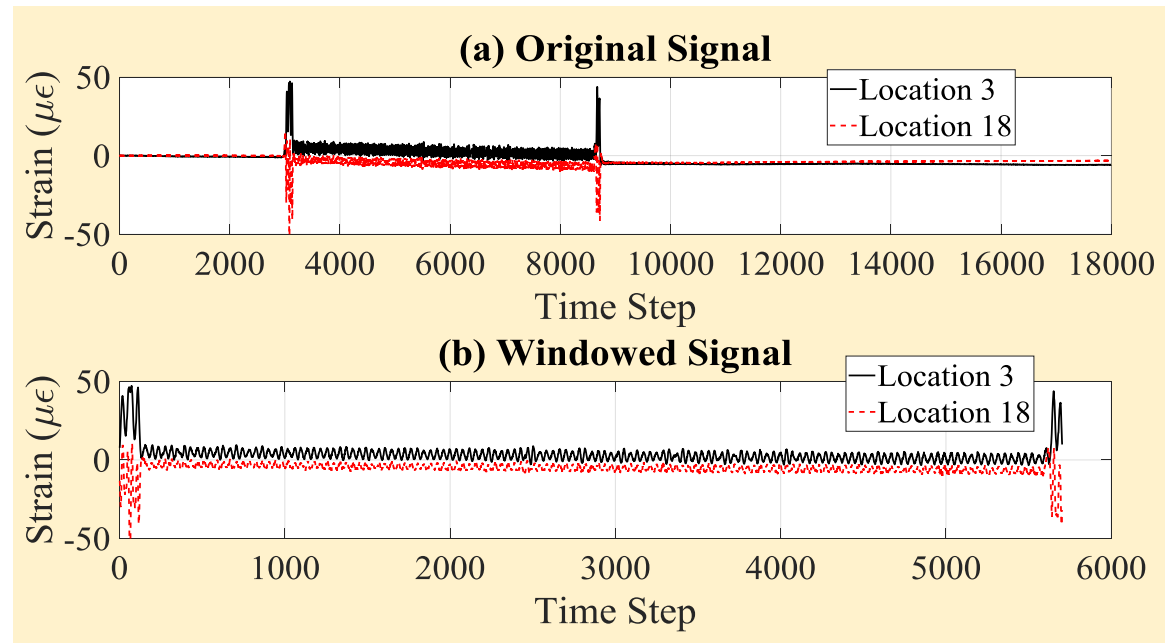

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018

- **Stringer-to-floor beam connection damage detection – Field based**
 - ✓ **POMs/loading effects:**
 - Data cleansing

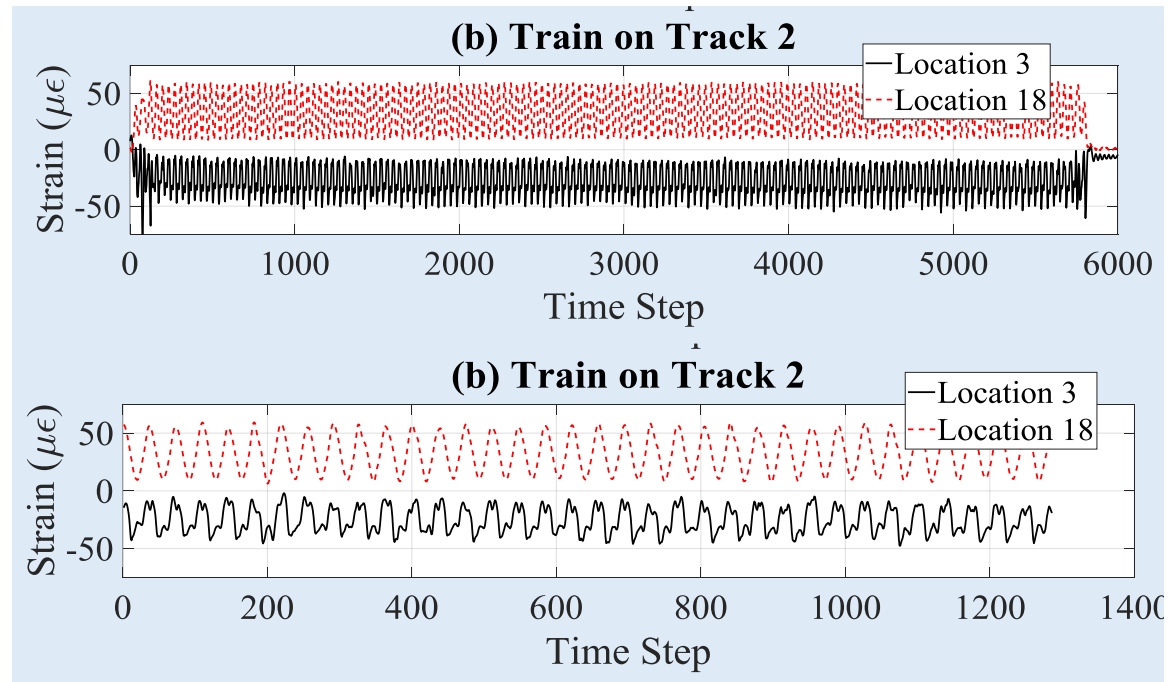

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018

- **Stringer-to-floor beam connection damage detection – Field based**
 - ✓ **POMs/loading effects:**
 - Data classifying and peak-picking

- **Stringer-to-floor beam connection damage detection –
Field based**

- ✓ **ANNs:**
 - Damage scenarios via reduced strains
 - ANNs trained using healthy and damaged POMs
 - ANNs tested using signal POMs

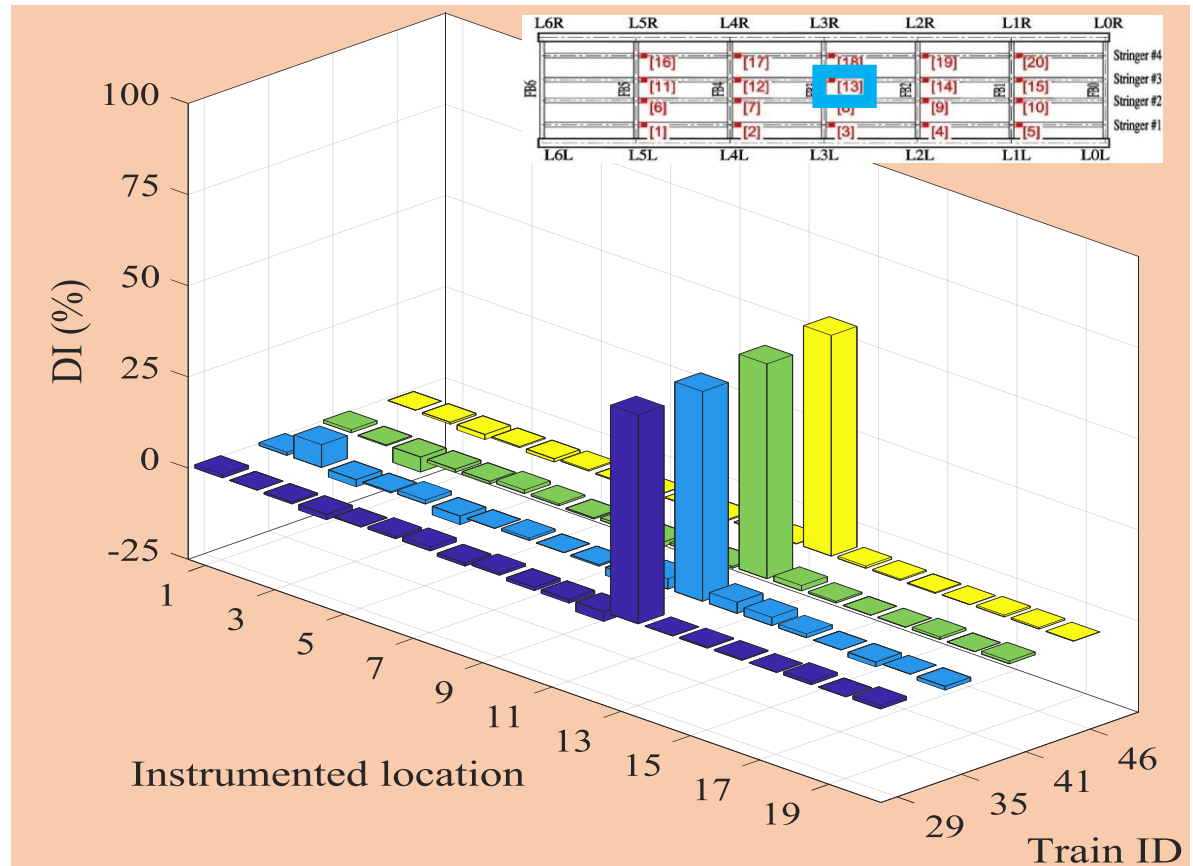

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018

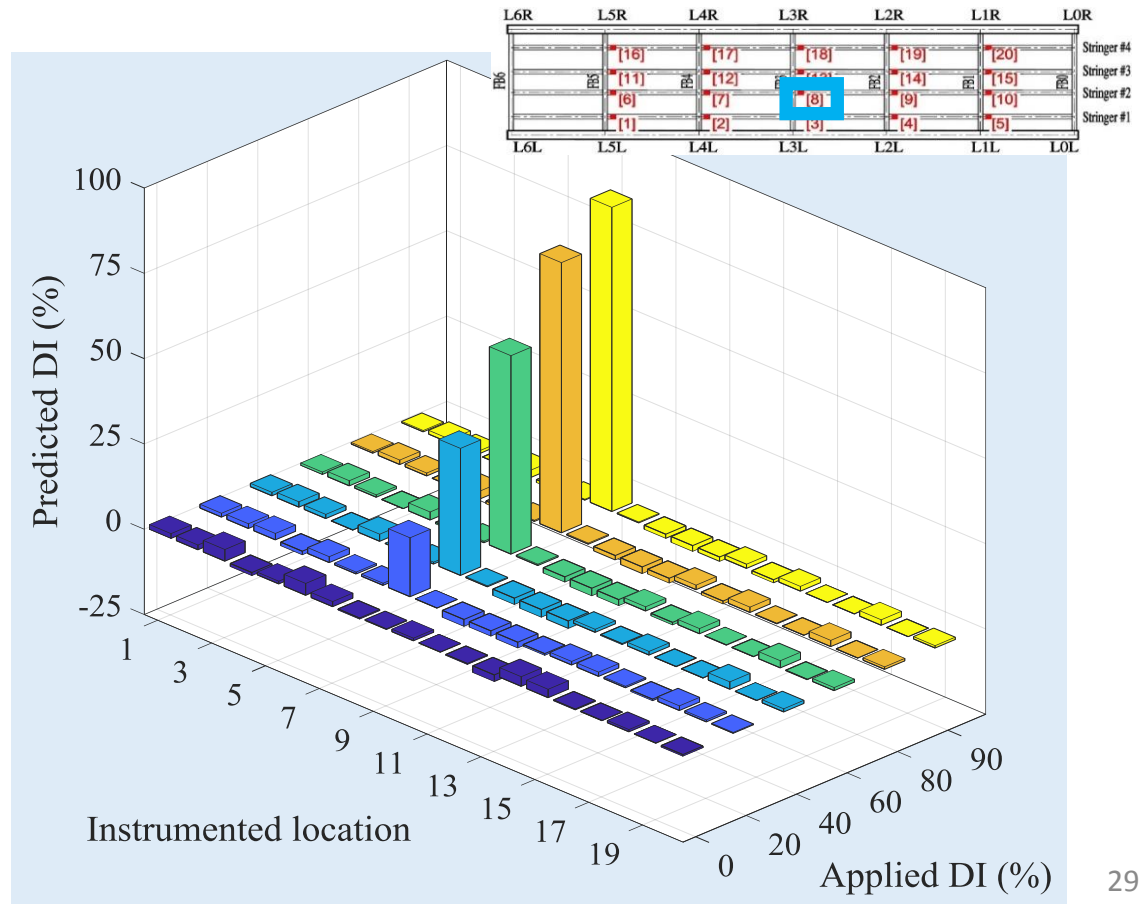

- **Stringer-to-floor beam connection damage detection – Field based**

**All Testing Trains
Location 13
DI = 60%**

- **Stringer-to-floor beam connection damage detection –
Field based**

**Train 29
Location 8
All DIs**

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018

• **Conclusions**

- ✓ Damage detected via strains induced by unknown, nonstationary external inputs
- ✓ Proper orthogonal modes are robust damage features
- ✓ Artificial Neural Network is required for identification of large number of damage indices
- ✓ Features for classification of unknown input from the response matrix were found

5th International Electronic Conference on Sensors and Applications

15 – 30 November 2018
