

# Design potent antimicrobial peptides against the ESKAPE pathogens based on human cathelicidin LL-37

**Guangshun Wang, Ph.D.**

*Department of Pathology and Microbiology*

4<sup>th</sup> International

# Outline

- I. Why bother with peptides?**
- II. How to identify peptide leads?**
- III. What's the state of the art of human LL-37 engineering?**
- IV. Summary**

# Part I: Why peptides?

# Why bother peptides?

**Small molecules:** not specific enough;

**Large biologics:** limited oral bioavailability.

Consequently, there is a great interest in developing **peptide drugs**.

# Peptide drug market

Lupron (Abbot lab) for prostate cancer sold over 2.3 billion in 2011.

Over 60 FDA-approved peptide drugs (e.g., daptomycin, colistin);  
140 under clinical trials;  
500 under preclinical development.

# Goals of peptide drug development

To identify proper leads and overcome the hurdles toward practical applications.

# Drug development stages

Lead identification (Novel?)

Optimization in vitro (SAR)

In vivo efficacy test (PK and PD);

Clinical trials (Safe, effective, affordable?)

Therapeutic use/withdrawal from the market

# Methods for lead identification

## (1) Library screening

in the lab;

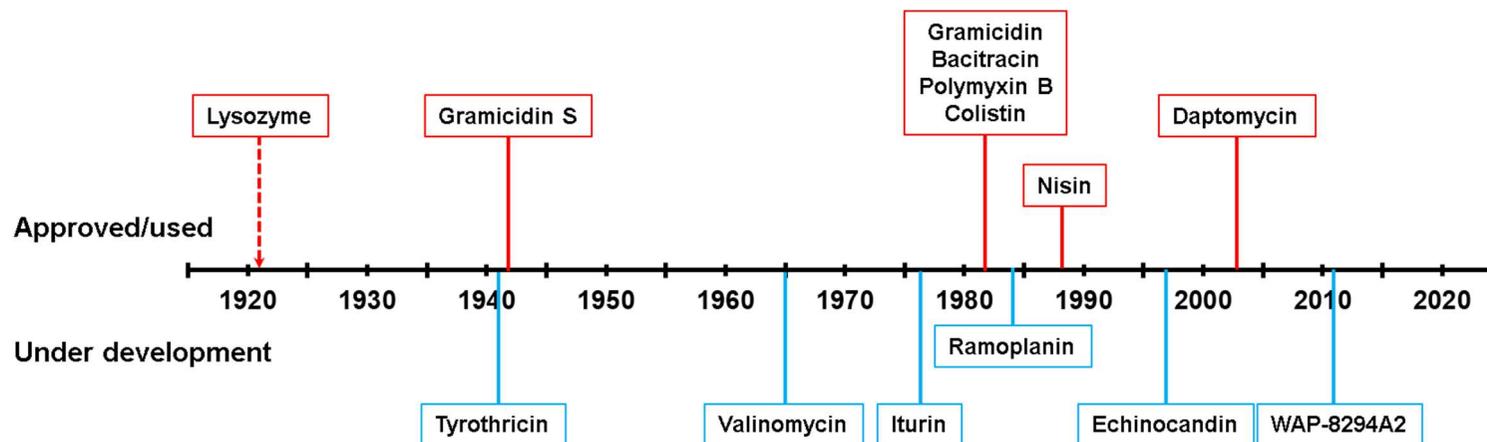

in the field;

and in silico;

## (2) Structure-based design (Rational design).

# Select antimicrobial peptides (AMPs) *in practical use (red) and under development (blue)*

Note that **lysozyme** is regarded as the first AMP and the beginning of innate immunity.

Mishra, B., Reiling, S., Zarena, D., Wang, G. (2017). Host defense antimicrobial peptide as antibiotics: design and application strategies. *Curr. Opin. Chem. Biol.* 38, 87-96.

# Natural Occurring Antimicrobial Peptides

## The Antimicrobial Peptide Database

[About](#) | [Database Search](#) | [Calculation & Prediction](#) | [Peptide Design](#) | [Statistics](#) | [AMP Facts](#) | [Contact](#)  
[AMP Timeline](#) | [Nomenclature](#) | [Classification](#) | [3D Structure](#) | [My Tools](#) | [Seq Download](#) | [FAQs](#) | [APD News](#) | [Glossary](#) | [Links](#) | [Opportunities](#) | [Conference](#) | [AMP News](#)

The **Antimicrobial Peptide Database (APD)** contains 3027 antimicrobial peptides from six kingdoms (336 **bacteriocins**/peptide antibiotics from **bacteria**, 4 from archaea, 8 from protists, 18 from **fungi**, 344 from **plants**, and 2236 from animals, including some synthetic peptides) with the following activity:

- Antibacterial peptides; Antibiofilm peptides
- Antiviral peptides; Anti-HIV peptides
- Antifungal peptides
- Antiparasitic peptides; Antimalarial peptides
- Anti-protist peptides
- Anticancer peptides
- Antioxidant peptides
- Chemotactic peptides
- Insecticidal peptides
- Protease inhibitors
- Spermicidal peptides
- Surface immobilized peptides
- Wound healing peptides

**This comprehensive database for antimicrobial peptides** is manually curated based on a set of **data-collection criteria**. There are 126 **human host defense peptides**, 281 from mammals annotated, 1068 active peptides from **amphibians (999 from frogs)**, 123 **fish** peptides, 38 **reptile** peptides, 42 from **birds**, 527 from **arthropods**, [295 from **insects**, 60 from **crustaceans**, 7 from **myriapods**, 165 from **chelicerata**, (43 from **spiders**, 83 from **scorpions**)], 42 from **molluscs**, 6 AMPs from protozoa, and more.

**Of the 403 unique 3D NMR/crystal structures annotated for host defense peptides in the APD, 283** with coordinates deposited in the Protein Data Bank (PDB) can be directly rotated, zoomed, and viewed. Top left: **Amphibian  $\alpha$ -helical magainin II**; Top right: **bovine  $\beta$ -sheet lactoferricin**; Bottom left: **plant  $\alpha\beta$ -PsD1**; Bottom right: **bovine  $\beta$ -non- $\alpha\beta$  indolicidin**.

**This original database consists of a pipeline of search functions for innate immune peptides.** You can search for peptide information using APD ID, peptide name, amino acid sequence, peptide motif, **chemical modification**, length, charge, hydrophobic content, PDB ID, **3D structure**, methods for structural determination, peptide source organism, peptide family name, life domain/kingdom (bacteria, archaea, protists, fungi, plants, animals), biological activity (see the links above), synergistic effects, target microbes, molecular targets, mechanism of action, contributing authors, and year of publication.

# AMPs from the six kingdoms

Kingdom	Count
bacteria	336
Archaea	4
Protists	8
Fungi	18
Plants	344
Animals	2236

Eukaryota: 2606 (86%)

Total: 3027 (Oct 2018)

# Unified classification of 3D structures: $\alpha$ , $\beta$ , $\alpha\beta$ , and non- $\alpha\beta$

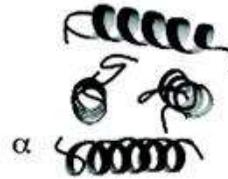

A. Frog aurein 1.2

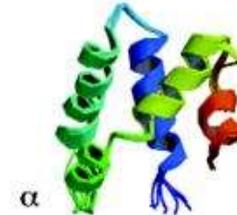

B. Human cathelicidin LL-37

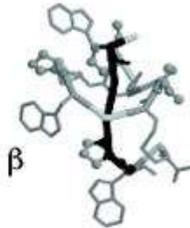

C. Frog distinctin

D. Worm caenopore 5

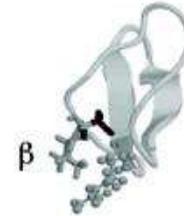

E. Lasso: BI-32169

F. Rhesus theta defensin 1 (RTD-1)

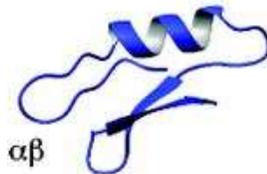

G. Plant kalata B1

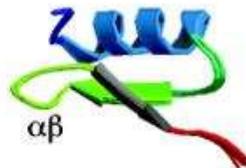

H. Human alpha defensin 1 (HNP1)

I. Fungal plectasin

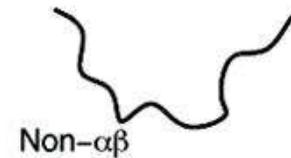

J. Mussel MGD-1

K. Human beta defensin 1 (hBD-1)

L. Bovine indolicidin

Wang, G. (ed.) 2010. *Antimicrobial Peptides: Discovery, Design and Novel Therapeutic Strategies*, CABI, England.

# Select human AMPs

**Lysozyme** (1922) in saliva, tears, and intestine;

**Alpha-defensins HNP-1** (1985) in neutrophils and bone marrow;

**Histatins** (1988) in saliva;

**RNase 2** (1990) in eosinophils;

**Beta-defensin HBD-1** (1995) in kidney, skin, saliva;

**Cathelicidin LL-37** (1995) skin and neutrophils;

**Granulysin** (1998) in cytolytic T cells and NK cells;

**Ubiquicidin** (1999) in macrophages;

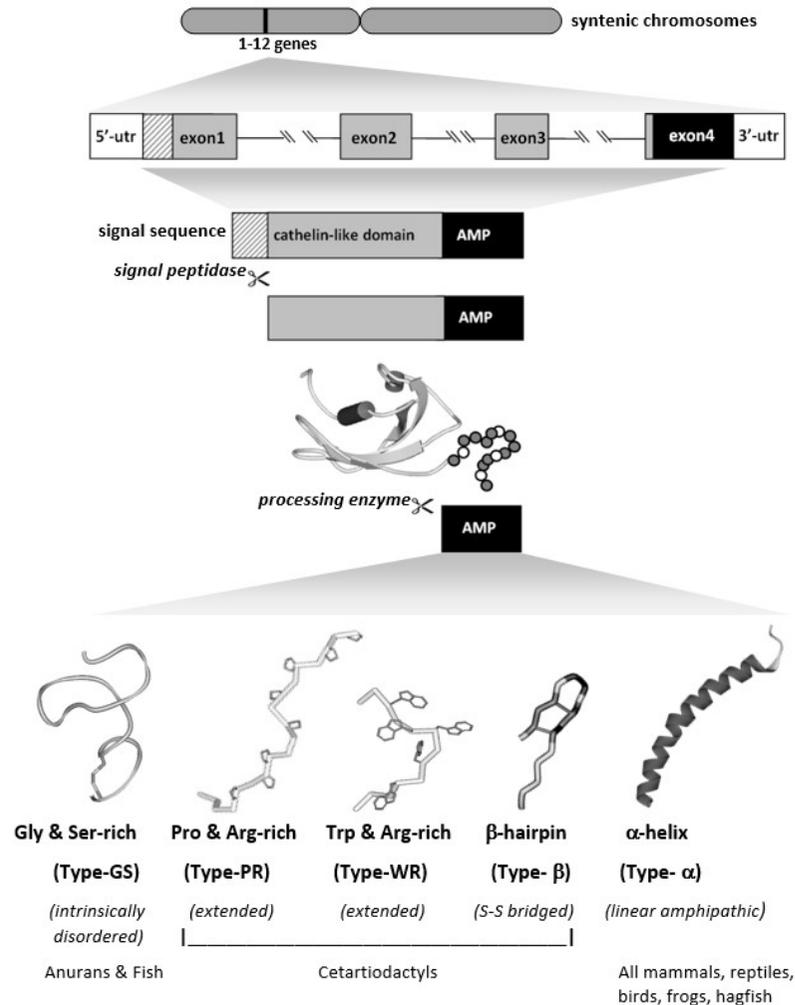

**Thrombocidin-1** (2000) in human blood platelets;

**Dermcidin** (2001) in skin and sweat

Wang G (2014) *Pharmaceuticals* 7, 545-594.

# Cathelicidins: biosynthesis and cleavage

## N-terminus:

The cathelin domain is **highly conserved** and can be used to **predict cathelicidins** in the genome.

## C-terminus:

The mature antimicrobial peptide is extremely variable in terms of sequence and structure.

Tossi et al. (2017). In "Antimicrobial Peptides" (Wang G, ed.), Chapter 2

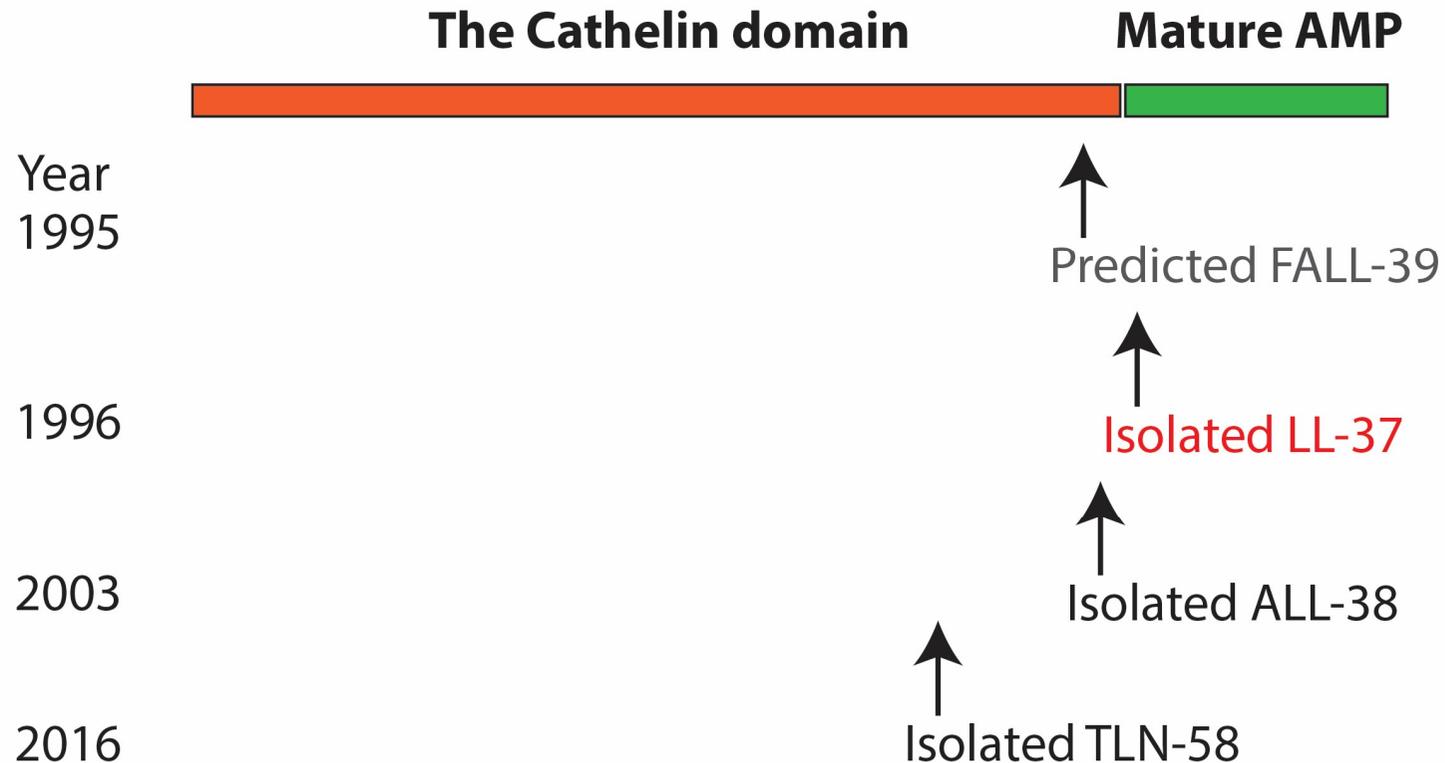

# The only human cathelicidin: a helical peptide

The human genome project was started in 1990 and completed 2003.

There are multiple copies of genes in horse, sheep and cattle, but only one cathelicidin gene in humans.

# Cathelicidin: one gene, multiple peptides

Refs: 1) Agerberth et al., 1995; 2) [Gudmundsson GH et al., 1996](#); 3) Sorensen OE et al, 2003; 4) Murakami et al., 2016 (lesion vesicle of palmoplantar pustulosis in the skin).

# Human cathelicidin LL-37 and its relationship with disease

**Patients** with morbus Kostmann and atopic dermatitis have a low level of cathelicidin (Putsep et al., 2002).

**Gene KO** mice increased infection and overexpression reduced infection (Nizet et al., 2001; Lee et al. 2005).

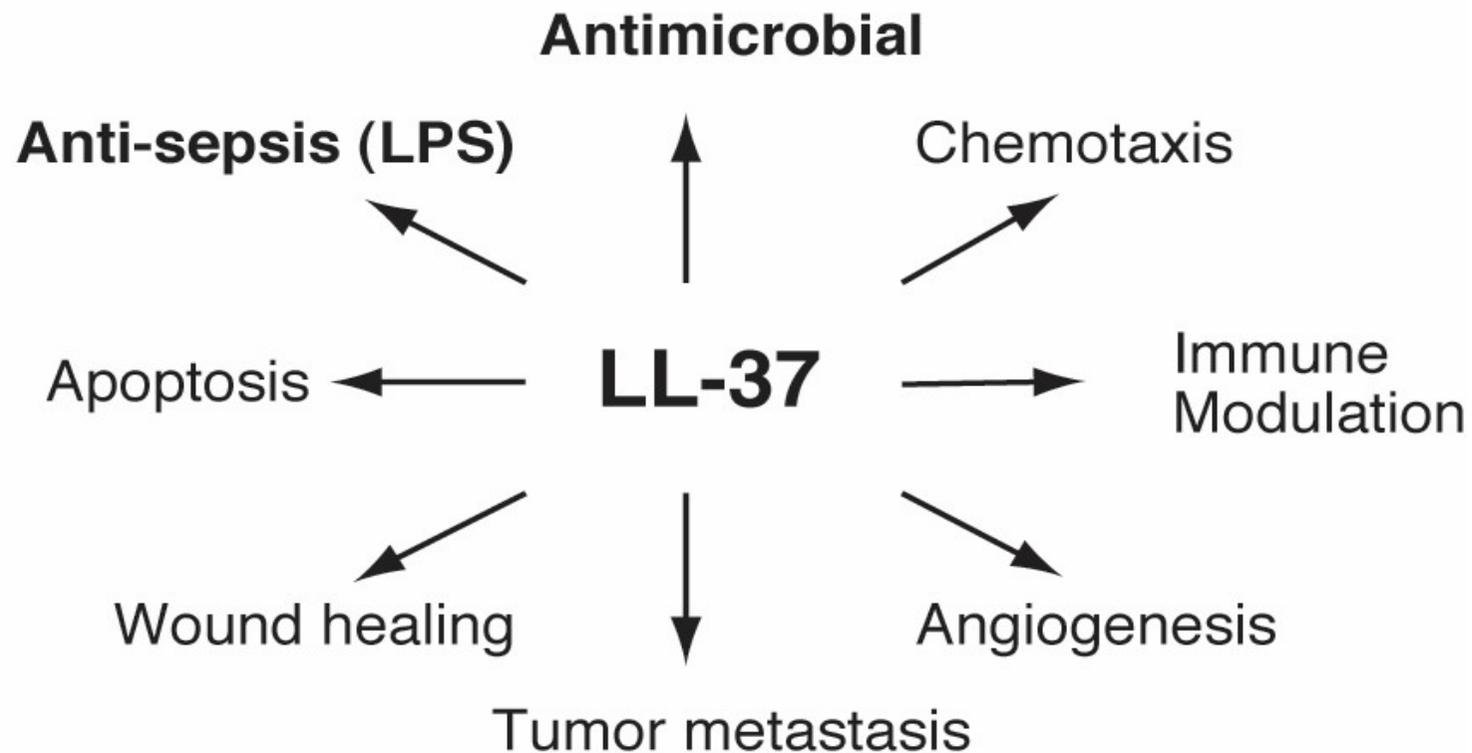

Binding to LPS (endotoxin) protects rats from **sepsis** (Cirioni et al., 2006).

LL-37 is reduced in **cystic fibrosis** due to interactions with DNA and filamentous F-actin (Bucki et al. 2007).

LL-37 is overexpressed in breast, ovarian and lung **cancers** (Wu, Wang, Coffelt et al. 2010).

# Multiple functions of LL-37: an innate immune peptide

Wang et al. (2014) *Biochim. Biophys. Acta* 1838: 2160-2172.

*There is a great interest in  
developing LL-37 into  
therapeutic molecules*

# Part II: How to identify peptide leads?

**Antimicrobial peptides (AMPs)**

# LL-37-based peptide library

# Peptide library design

Commonly designed libraries:

- 1) Overlapping library (seq scanning);
- 2) Alanine scanning;
- 3) Positional library;
- 4) Truncation;
- 5) Random library;
- 6) Scrambled library (seq is important).

# LL-37 peptides

1. 37 amino acids (long and costly);
2. Decide on the peptide length (20, 22, 24mer?);
3. Scan the sequence from the N-terminus to the C-terminus;
4. Make peptides;
5. Quality check;
6. Antimicrobial assays
7. Cytotoxicity assays
8. Most selective and potent peptide.

# LPS-neutralizing activity

Peptide	Sequence	IC50 (uM)
LL-37	LLGDFFRKSKEKIGKEFKRIVQRIKDFLRNLPRTES	0.29
LL-22	LLGDFFRKSKEKIGKEFKRIVQ	>3
.		
.		
.		
IG-24(P60)	IGKEFKRIVQRIKDFLRNLPRTES	0.48
P60.4	IGKEFKRIVERIKRFLRELVRPLR	0.55

The most promising peptide is P60.4, a 24 amino acid peptide with similar efficacy as LL-37 in terms of LPS and LTA neutralization and lower pro-inflammatory activity.

Nell MJ et al. (2006) [Peptides](#). 2006 Apr;27(4):649-60.

# SAAP-148 is topically effective

Peptide	Sequence	LC99.9 ( $\mu\text{M}$ )	PBS 50% plasma
LL-37	LLGDFFRKSKEKIGKEFKRIVQRIKDFLRNLPRTES	1.6 (1.6–6.4)	>204.8
P139	LKKLWKRVFRIWKRIFRYLKRPVR	1.6 (0.8–1.6)	51.2
P140	LRRLWKRLVRIIKRIYRQLKRPVR	1.6	38.4 (25.6–51.2)
P141	LRRLYKRVFRLKRWRYLKRPVR	1.6 (0.8–1.6)	38.4 (25.6–51.2)
P142	LRRLWKRLVKILKRWFYLRPVR	1.6 (0.8–1.6)	51.2 (51.2–102.4)
P143	LRRLYKRVVKLWKRLFRLRPVR	1.6 (1.6–3.2)	51.2 (51.2–102.4)
P144	LKKLYKRVAKIWKRWIRYLKRPVR	1.6	38.4 (25.6–51.2)
P145 (SAAP-145)	LKRLYKRLAKLIKRLYRYLKRPVR	1.6 (0.8–1.6)	12.8 (12.8–25.6)
P146	LKKLYKRLFKILKRILRYLRPVR	1.2 (0.8–1.6)	51.2 (25.6–51.2)
P147	LKKLWKRLARLLKRFIRQLRPVR	1.6	51.2 (25.6–51.2)
P148 (SAAP-148)	LKRVWKRVPKLLKRYWRQLKRPVR	1.6	12.8 (12.8–25.6)

1. SAAP-148 formulated in an ointment is safe in an animal model (a 3.75% (w/w) hypromellose gel base);
2. SAAP-148 ointments are highly effective against (biofilm)-associated skin infections.

[de Breij A et al. \(2018\). \*Sci Transl Med\*. Jan 10;10\(423\). pii: ean4044.](#)

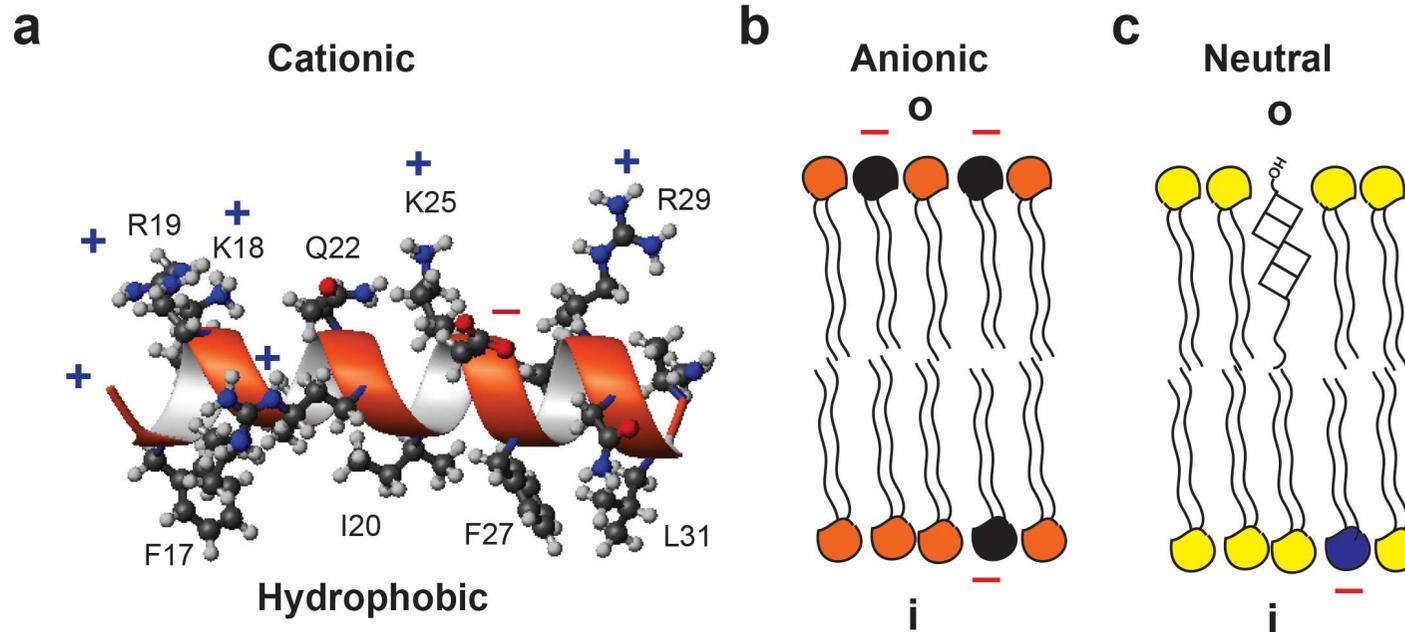

# Structure-based design

# Physical basis of peptide selectivity

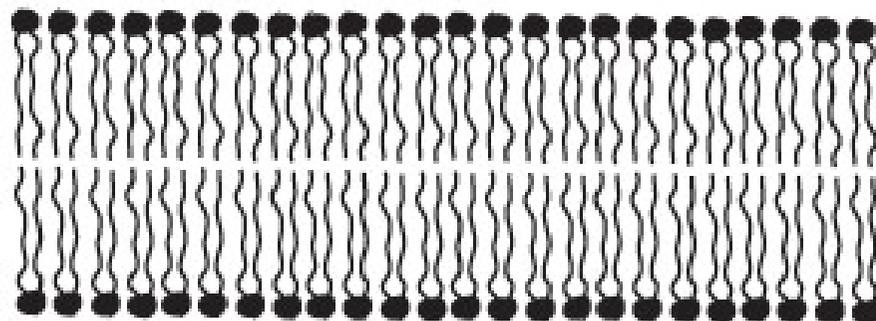

The amphipathic helix of cationic AMPs (a) is ideal to interact with anionic bacterial membranes (b), but not zwitterionic human cell membranes (c).

# 17BIPHE2 damages bacterial Membrane

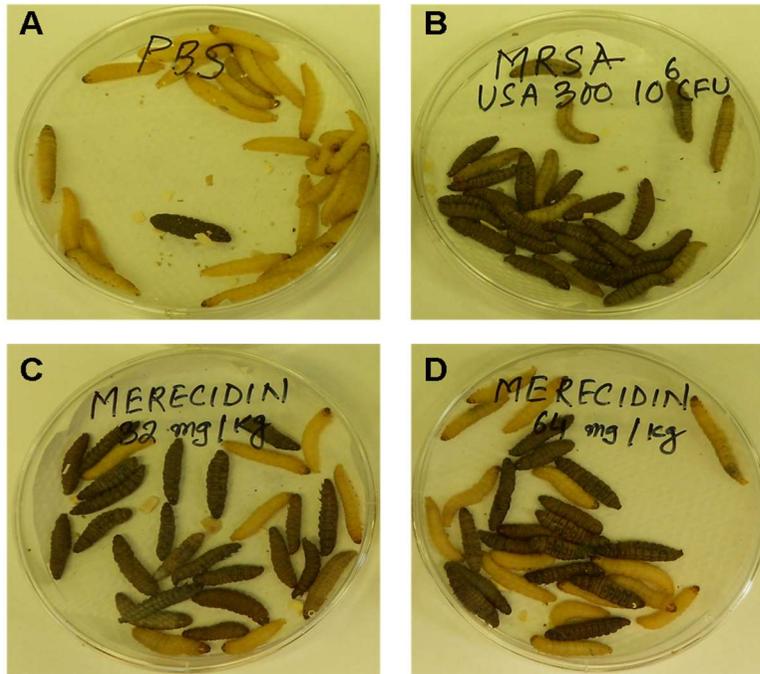

**TEM:** before and after peptide treatment.

**Propidium iodide:** membrane permeation is slightly more potent than GF-17

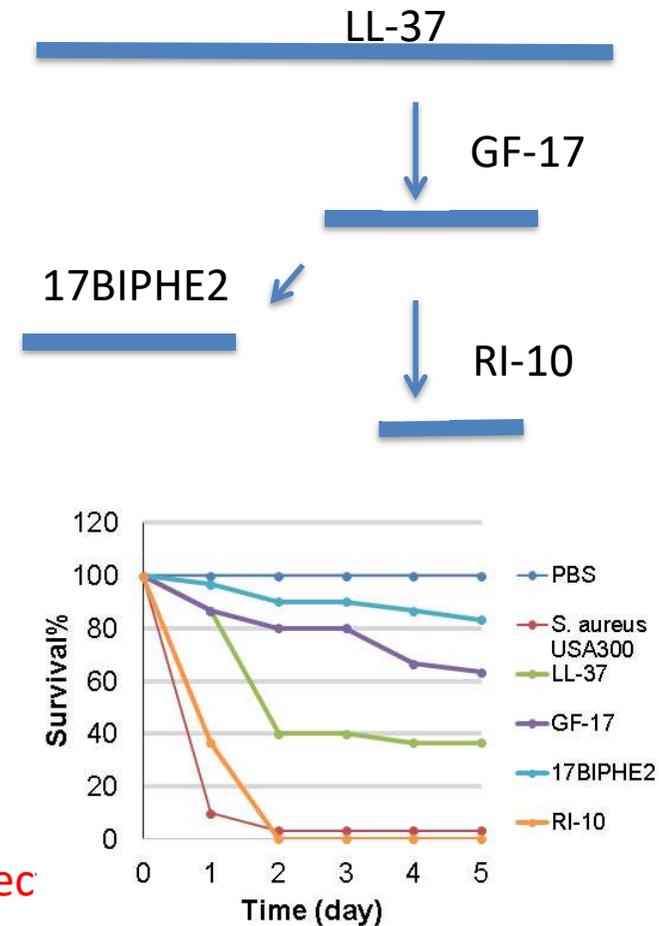

# *In vivo model I: the wax moths model illustrate advantages of peptide engineering*

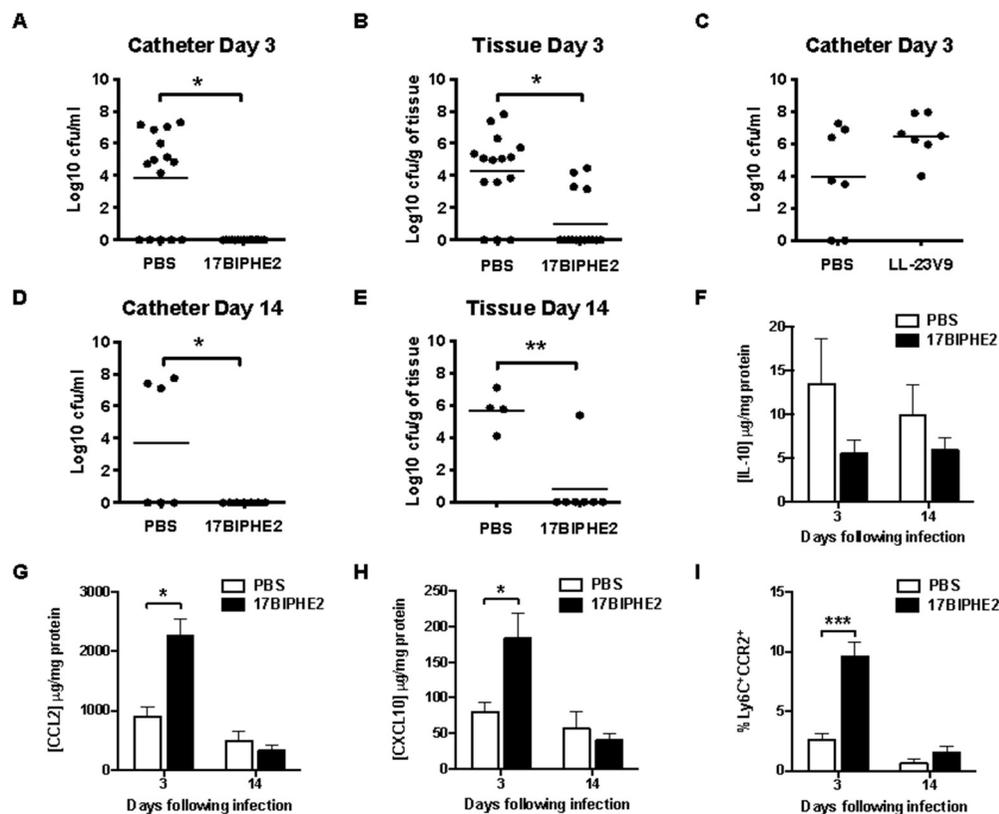

*Galleria mellonella*

The engineered peptide 17BIPHE2 is most effective in this model compared to LL-37 and its native fragments.

# *In vivo* model II: a catheter *S. aureus* Biofilm model (by Tammy Kielian's lab)

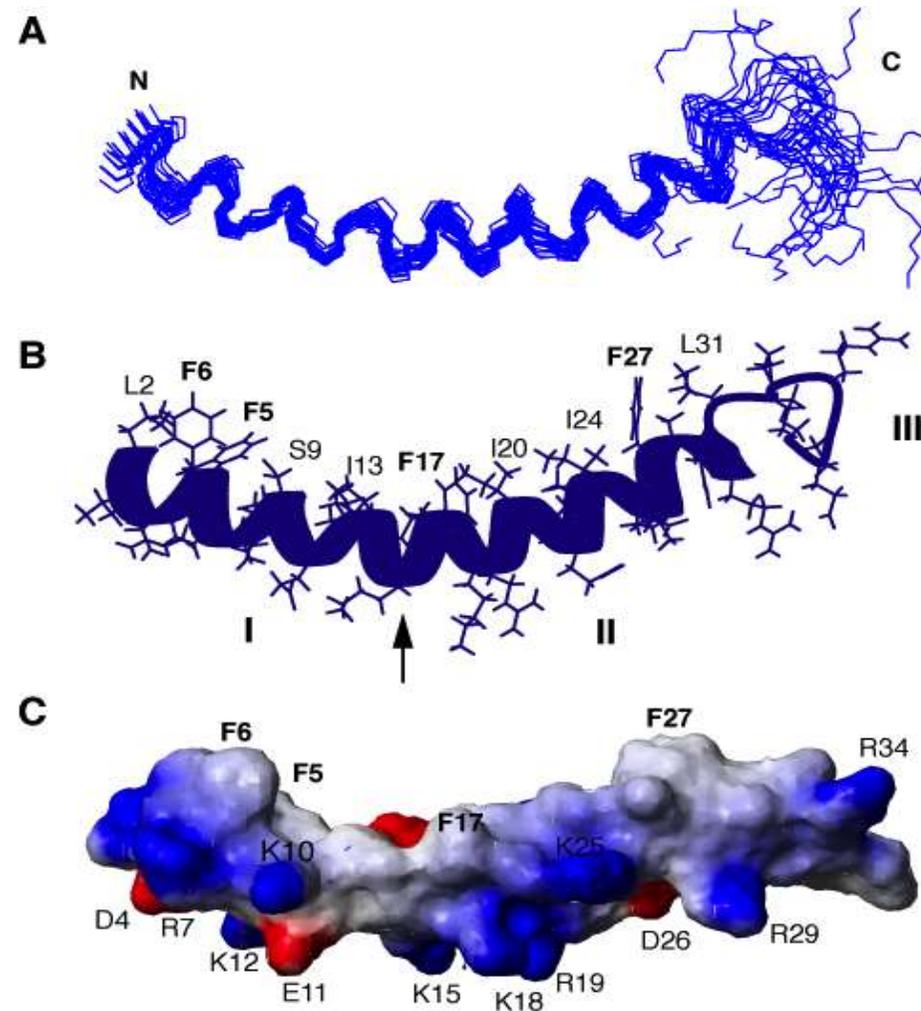

While an inactive peptide did not work (c), 17BIPHE2 was effective in reducing MRSA CFU in the catheters (A & D) and surrounding tissues (B & E) at both days 3 and 14. In addition, the peptide was able to induce MCP-1 at day 3 (G) that recruited monocytes (I) to further clear the infection.

# The NMR structure of LL-37 bound to SDS micelles

- A. Superimposed Backbone;
- B. Ribbon diagram;
- C. Potential surface.

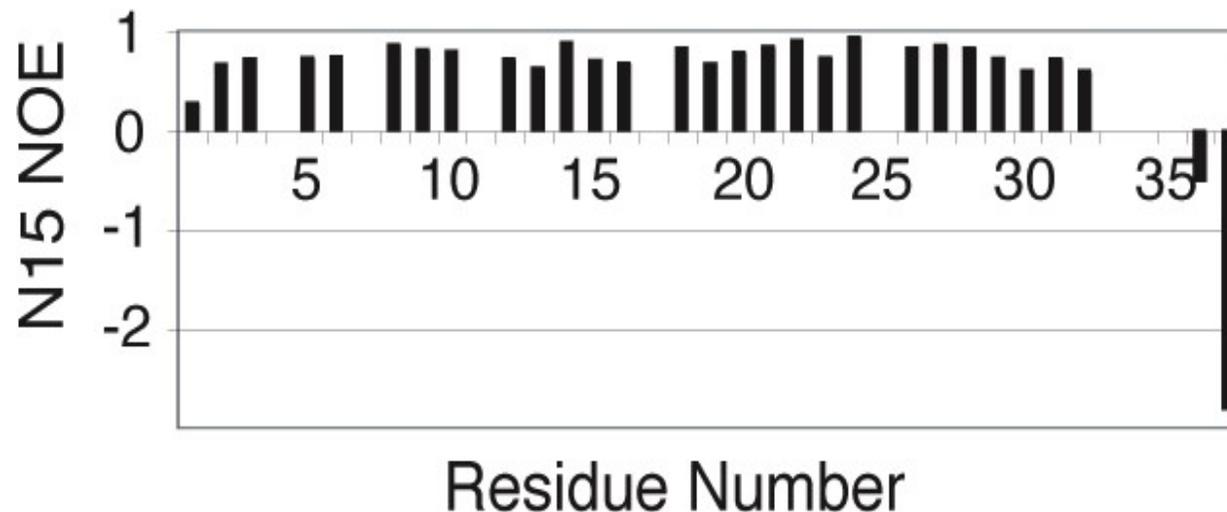

3D NMR studies revealed a helical structure for human LL-37 covering residues 2-31, while the tail portion is disordered.

Wang, G. (2008) *J Biol Chem* 283: 32637.

# NMR Dynamics: Depicting the Motional Picture of Micelle-bound Human LL-37

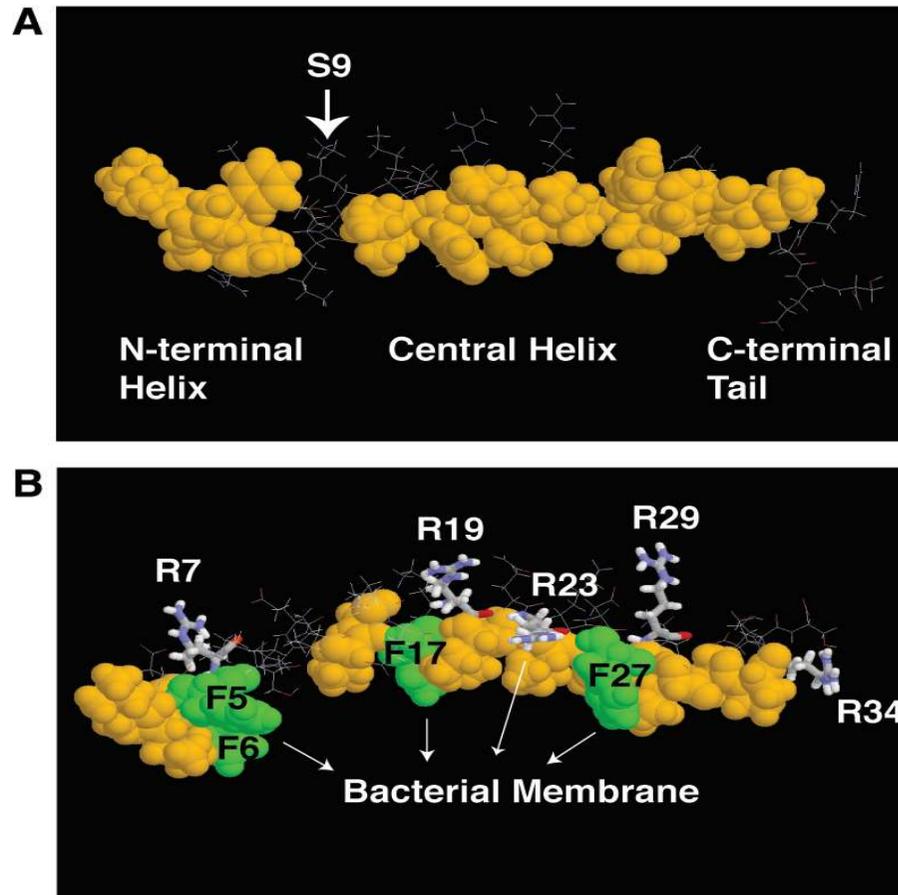

This figure indicates that residues 2-32 are ordered, while the C-terminal tail of LL-37 is mobile. This picture is fully consistent with the 3D structure of LL-37 determined independently without using this backbone dynamics information.

Wang, G. (2008) *J Biol Chem* 283: 32637.

# Structural light on antibacterial, antibiofilm, and antiviral activity of LL-37

## Structural validation

**1:** Peptide dynamics.

**Validation 2:** structure bound to anionic phosphatidylglycerol is the same.

**Validation 3:** structure bound to LPS also indicates a disordered C-terminal tail.

Wang et al. (2014) *Biochim. Biophys. Acta* 1838: 2160-2172.

# Advanced application strategies

Mishra, B., Reiling, S., Zarena, D., Wang, G. 2017. Host defense antimicrobial peptide as antibiotics: design and application strategies. *Curr. Opin. Chem. Biol.* 38, 87-96.

# Summary

1. Over 3000 natural antimicrobial peptides have been identified and registered in the antimicrobial peptide database (<http://aps.unmc.edu/AP>). Importantly, some AMPs are already in use.
2. There is a great interest in developing the therapeutic use of human cathelicidin LL-37.
3. Both library screen and structure-based design are in use. They can be combined.
4. LL-37 derived peptides can kill the ESKAPE pathogens, disrupt biofilms, and show topical efficacy in animal models.
5. The engineered peptide 17BIPHE2 is superior to LL-37 and its native fragments in protecting the wax moths.
