Lactose-based Fatty Acid Monoesters: Synthesis, antimicrobial activity and permeability enhancement studies

Abstract: We present the synthesis and the in vitro assaying of a series of lactose-based non-ionic surfactants, highlighting the relationship between their structure and biological effect. Using tensiometric measurements the critical micelle concentrations (CMCs) of the surfactants were determined and demonstrate that increasing hydrophobic chain length reduces surfactant CMC. In vitro testing on Caco-2 intestinal and Calu-3 airway epithelia revealed that cytotoxicity is present, for most of the surfactants, at concentrations greater than their CMCs. Importantly, through the culture of epithelial monolayers on Transwell® supports, the surfactants demonstrate the ability to reversibly modulate transepithelial electrical resistance (TEER), and thus open tight junctions, at non-toxic concentrations. The surfactants were then tested for their ability to improve the in vitro permeability of Ovalbumin and Dextran, confirming their potential application as safe permeability enhancers in vivo. Moreover, the synthesized compounds exhibit antimicrobial activity versus eight pathogenic species belonging to Gram-positive, Gram-negative microorganisms and fungi.

Keywords: absorption enhancers; sugar-based surfactants; biocompatibility studies; transmucosal drug delivery, antimicrobial

Surfactants

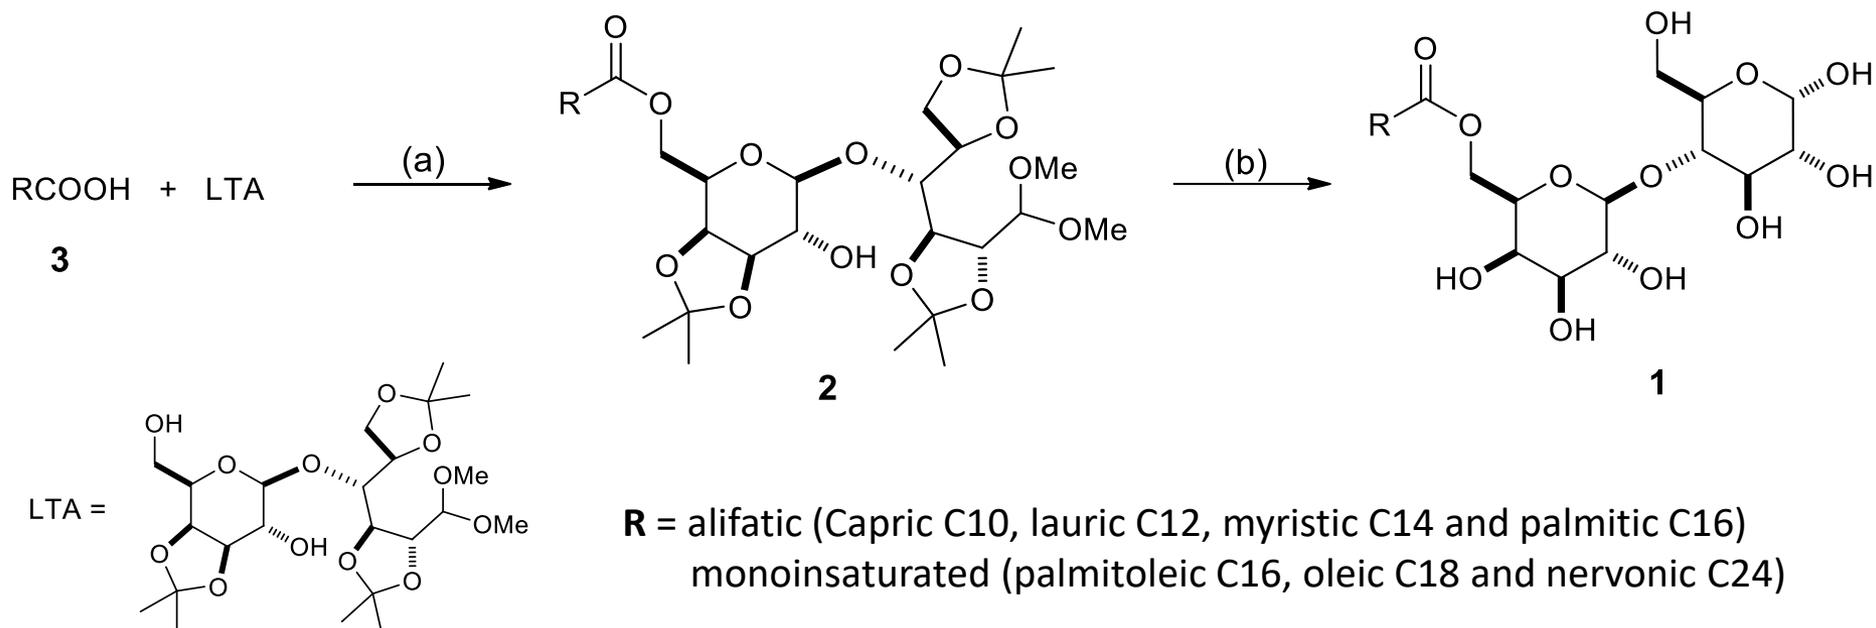

Sugar-based Surfactants

- ❑ **SUGAR FATTY ACID ESTERS** are a class of non-ionic, biodegradable and biocompatible surfactants
- ❑ They have a broad applications in the **food, pharmaceutical** and **personal care** industries (*sucrose fatty acid esters have been commercially manufactured at high volume since the early 1960s.*)
- ❑ Emerging sugar-based surfactants: Sucrose esters, alkyl glycosides, alkyl maltosides and rhamnolipids
- ❑ New antimicrobial agents
- ❑ Limited studies on Lactose-based surfactants

Synthesis of Lactose-based Fatty Acid Monoesters

Reaction conditions: (a) Lipozyme, toluene, 75°C, 12 h; (b) $\text{HBF}_4 \cdot \text{Et}_2\text{O}$, CH_3CN , 30°C, 3 h.

Growth inhibition by time-kill experiments of Foodborne Pathogens

Food-borne pathogens:	Growth inhibition by			
	Lactose palmitoleate (µg/mL)		Lactose nervonate (µg/mL)	
	MIC	2MIC	MIC	2MIC
<i>L. monocytogenes</i> ATCC 7644				
3 h	2.41%	5.99%	3.55%	5.38%
6 h	5.40%	8.94%	6.49%	8.89%
24 h	9.32%	15.33%	10.64%	14.85%
<i>E. coli</i> O157:H7 ATCC 35150				
3 h	11.47%	14.20%	5.78%	9.51%
6 h	16.00%	20.82%	11.88%	16.50%
24 h	19.10%	22.08%	13.95%	19.47%
<i>S. enteritidis</i> ATCC 13076				
3 h	12.16%	15.67%	11.68%	16.81%
6 h	22.82%	28.08%	23.80%	29.66%
24 h	23.13%	29.84%	26.20%	30.88%

Percentages of growth inhibition induced by Lactose Palmitoleate and Lactose Nervonate, at their MIC and 2xMIC concentrations, toward *E. coli* O157: H7 ATCC 35150, *L. monocytogenes* ATCC 7644 and *S. enteritidis* ATCC 13076, as assessed in time-kill experiments (in bold were signed the highest percentages of bacterial growth inhibition after 24 h of incubation with each compound).

Lucarini S. et al., *Eur J Pharm Biopharm* **2016**, 107, 88-96.

Conclusions

Lactose-based surfactants are an emerging broad group of biocompatible and biodegradable compounds with established and potential future applications in the pharmaceutical, biomedical, cosmetic and food industries.

This work:

- Enzymatic-“Green” Synthesis of aliphatic and monounsaturated fatty acid lactose esters
- CMCs decrease with the increasing of the hydrophobic chain length
- Cytotoxicity at greater concentrations of CMC (safe surfactants)
- TEER experiments and Permeability studies (FITC-OVA and -Dextran) demonstrate that our lactose-based surfactants are promising permeability enhancers
- Antimicrobial activity and time-kill studies against foodborne pathogens shown a further possible application as a safe preservatives for food, cosmetics, etc.
