Published: date

Abstract: An effective synthesis of functionalized thiopyrano [2,3-*b*]quinolines has been described via a cascade reactions using a super paramagnetic iron oxide nanoparticles (SPIONs) coated with L-arginine (Arg) grafted alginate (Alg) called Fe₃O₄@Alg@CPTMS@Arg. The reaction was performed between commercially available CH acids compounds such as dimedone or malononitrile, and 2-mercapto-quinoline-3-carbaldehydes under green conditions. This efficient method provides a new route for the formation of functionalized three or four fused rings.

Keywords: L-arginine; alginate; superparamagnetic nanocomposite; 2-mercapto-quinoline-3-carbaldehydes; thiochromene derivatives

1. Introduction

Nowadays, a major challenge in preparation of effective medicinal compounds are to design well-organized methods based on the application of recyclable biocatalyst. Iron oxide (Fe₃O₄) due to prominent characteristics such as superparamagnetic properties, vast surface area, and low toxicity has valuable consideration in modification of biocompatible conditions [1]. Polymers which are modified by Fe₃O₄ are a good choice for catalyst applications [2,3]. Although there are many different types of polymers, among them, natural origin polymers have the most achievements today due to their environmentally friendly conditions [4]. Subdivisions of these natural polymers include polysaccharides such as alginates originating from brown seaweed with alternating groups of (1→4) α-L-guluronic acid (G) and (1→4) β-D-mannuronic acid (M) units with specific functional groups in its structure have the ability to interact appropriately with other excellent compounds, including the amino acid arginine as bi-functionalized natural polysaccharide, strikingly, play role of catalyst [5,6]. In continuation of our efforts in the optimal synthesis and evaluation of heterogeneous catalyst performance for outstanding pharmaceutical compounds, therefore, we report our results for a facile and convenient synthesis thiopyrano [2,3-*b*]quinoline derivatives using arginine functionalized alginate as a highly efficient biocatalyst.

2. Experimental

2.1. Reagents and Apparatus

All commercial solvents and chemicals were purchased from Merck & Aldrich. Deionized water was used for all dilutions. The IR spectrum is recorded on a Shimadzu 470 FT-IR spectrometer. Ultrasound was performed by Alma at 60 Hz. The melting points of the samples were measured by

the Electrothermal 9100. The ^1H NMR and ^{13}C NMR spectra at 500 MHz and 125 MHz (^{13}C) were recorded on the Bruker DRX-500 Avance spectrometer, which is fully consistent with those reported in authentic samples or reported in the literature.

2.2. Synthesis of $\text{Fe}_3\text{O}_4@ \text{Alg}$ Nanoparticles

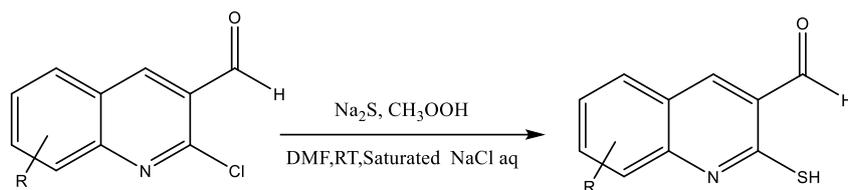

$\text{Fe}_3\text{O}_4@ \text{Alg}$ nanoparticles were prepared by the co-precipitation method. In order to the synthesis of catalyst, the reaction was done by the reaction between $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$ (4.68 g, 17.31 mmol), $\text{FeCl}_2 \cdot 4\text{H}_2\text{O}$ (2.3 g, 11.56 mmol) with sodium alginate (1 g) Stirred vigorously for 2 h at 50 mL of deionized water (DI) as a solvent in an inert atmosphere. After that, the pH of the solution was adjusted to 10 by adding dropwise of aqueous ammonia solution (25%). The produced magnetic nanoparticles were separated by an external magnet, the solid procured was washed with H_2O and EtOH, and finally dried for 7 h at 100 ° C to be used for the next step of catalysis synthesis.

2.3. Synthesis of $\text{Fe}_3\text{O}_4@ \text{Alg}@ \text{CPTMS}@ \text{Arg}$

The mixture of $\text{Fe}_3\text{O}_4@ \text{Alg}$ nanoparticles (1.5 g), 3-chloropropyltrimethoxysilane (3 mL, 16.45 mmol), and dry toluene (20 mL) was dispersed under ultrasonic irradiation for 20 min, to obtain a milky suspension. The solid was separated by an external magnet, washed with absolute ethanol, and then dried in an oven for 12 h. To a suspension of $\text{Fe}_3\text{O}_4@ \text{Alg}@ \text{CPTMS}$ (1 g) in dry toluene, L-arginine (1.5 g, 8.61 mmol) and trimethylamine (0.07 g, 1.2 mmol) were added and refluxed for 48 h. Afterward, the obtained nanoparticles were separated by a magnet, washed with EtOH and DI, and then dried in a vacuum oven at 110 ° C for 6 h to obtain $\text{Fe}_3\text{O}_4@ \text{Alg}@ \text{CPTMS}@ \text{Arg}$.

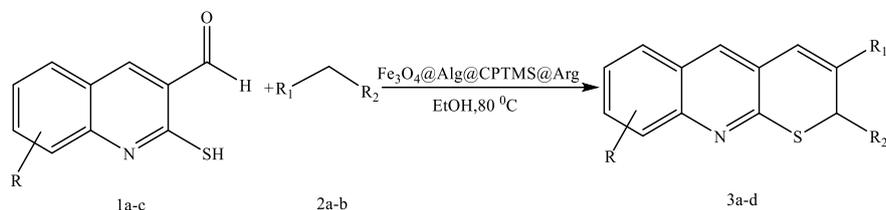

3. Results and Discussion

The ability of $\text{Fe}_3\text{O}_4@ \text{Alg}@ \text{CPTMS}@ \text{Arg}$ to synthesize 2-mercaptoquinoline-3-carbaldehyde was investigated in ethanol under reflux condition. The Synthesis of 2-mercaptoquinoline-3-carbaldehyde derivatives was performed in two steps. In the first step, 2-chloroquinoline-3-carbaldehyde (4 mmol), sodium sulfide (16 mmol), and DMF (10 mmol) were added to a round bottom flask and the mixture was vigorously stirred at room temperature for 2 h to obtain an orange solution. A saturated solution of sodium chloride (40 mL) was then added to the reaction mixture. Glacial acetic acid was gradually added to the reaction mixture to make the solution clear and to prevent further precipitation. Finally, the precipitate was filtered, washed with water, and dried at ambient temperature to prepare 2-mercaptoquinoline-3-carbaldehyde (Scheme 1).

Scheme 1. Synthesis of 2-mercaptoquinoline-3-carbaldehyde.

The catalytic activity of the as-prepared nanocomposite was studied in the synthesis of thiopyrano derivatives **3a–d** (Scheme 2). The reaction was investigated for CH acidic compounds **2a–b** and 2-mercaptoquinoline-3-carbaldehyde derivatives **1a–c** and the results are shown in Table 1.

Table 1. Synthesis of thiopyrano [2,3-*b*]quinolines by $\text{Fe}_3\text{O}_4@\text{Alg}@\text{CPTMS}@\text{Arg}$ nanocatalyst.

Entry	Product	CH-Acidic Compounds	Time (min)	Yield (%)	M.p. (°C) Found/Reported
1	 3a		40	75	192–194/192–194 [7]
2	 3b		35	60	140–143/139–141 [7]
3	 3c		30	80	156–158/156–158 [7]
4	 3d		30	65	200/197–199 [7]

4. Conclusions

In this work, the catalytic performance of super paramagnetic iron oxide nanoparticles (SPIONs) coated with L-arginine (Arg) grafted alginate, $\text{Fe}_3\text{O}_4@\text{Alg}@\text{CPTMS}@\text{Arg}$, has been investigated in the synthesis of thiopyrano [2,3-*b*]quinoline derivatives via condensation reaction of 2-mercaptoquinoline 3-carbaldehydes and CH-acidic compounds under mild and green conditions necessary for the development of sustainable chemistry. This methodology has several benefits, including recoverability of the catalyst, short reaction times, elimination of toxic solvents, and high yields.
