Abstract: 1) background: The desire to live longer lives demands novel strategies to perform this target. For that reason, in this work [1] the increase of the *Caenorhabditis elegans* (*C.elegans*) lifespan extension using hyper-branched cyclodextrin-based nanosponges (CD-NS) complexing oxyresveratrol (OXY) was evaluated. 2) Methods: The titration displacement of fluorescein was used to calculate the apparent complexation constant (K_f) between CD-NS and OXY. Moreover, PDE4 was expressed, purified and refolded in presence of cyclodextrins (CDs) to study its possible inhibition as pharmacological target of OXY. 3) Results: The effect of OXY on PDE4 displayed a competitive *in vitro* inhibition corroborated *in silico*. A maximum increase of the *in vivo* life expectancy of about 9.6% of using OXY/CD-NS complexes in comparison with the control was obtained without toxicity. 4) Conclusions: These results as a whole represent new opportunities to use OXY and CD-NS in lifespan products.

Keywords: lifespan; *Caenorhabditis elegans*; oxyresveratrol

Introduction

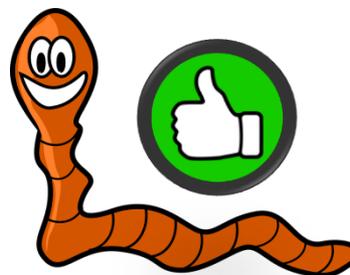

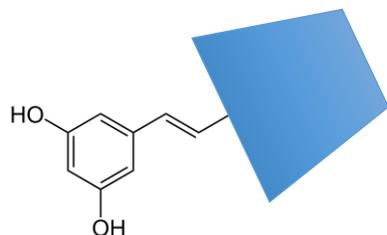

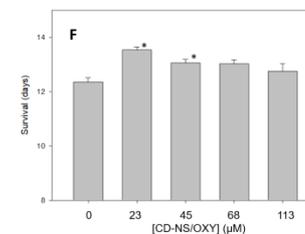

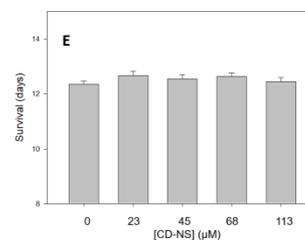

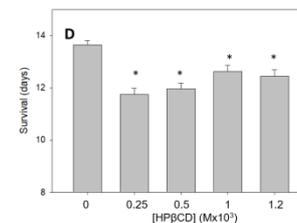

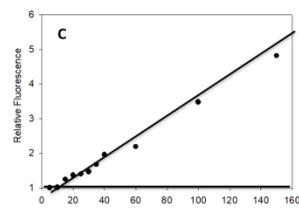

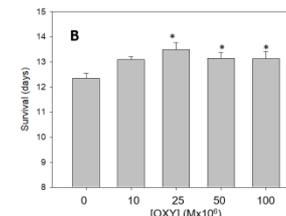

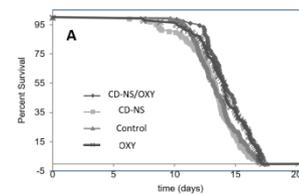

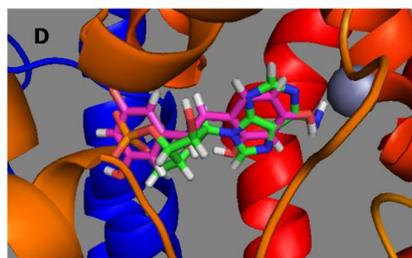

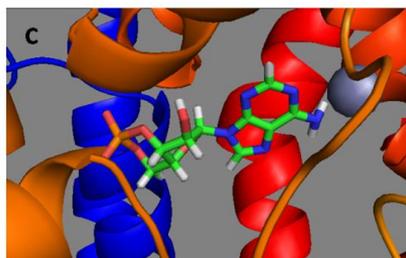

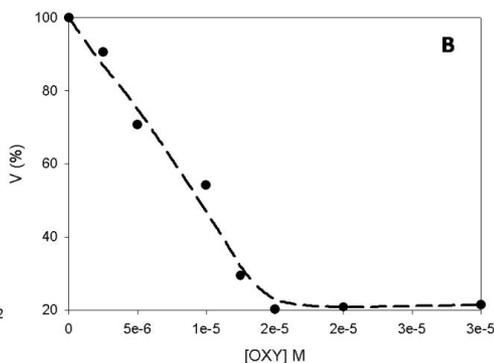

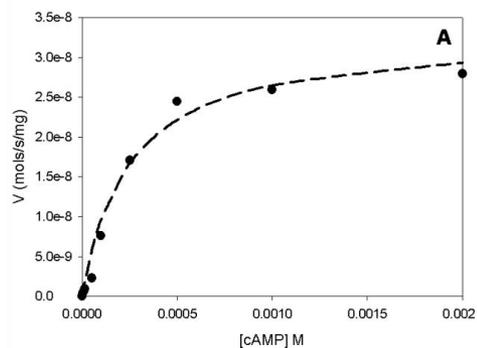

Results and Discussion 1: K_F for Oxyresveratrol/NSs

$$K_F = 1.20 \times 10^5 \text{M}^{-1} \pm 1.23 \times 10^4 \text{M}^{-1}$$

Results and Discussion 2: Effect of OXY against PDE4 and in *in vivo* lifespan
