Okadaic acid (OA) group of toxins produce Diarrheic Shellfish Poisoning after contaminated seafood ingestion leading to gastrointestinal symptoms such as diarrhoea 1. These polyether compounds are synthesised by dinoflagellates of the genera Prorocentrum and Dinophysis 2. Proteins Phosphatases (PPs), mainly PP1 and PP2A, are the known target of these phycotoxins 3. However, some information arise the possibility of OA affecting other pathways that would result in diarrhoea. A wide variety of diarrheic agents have been described to alter in the Enteric Nervous System 4. Neuropeptide Y (NPY) is a neuronal-origin peptide present in enteric and sympathetic neurons that exert an antidiarrheal tone 5. Previous in vitro studies have described that OA reduces NPY expression and release 3, 7-9. Thus, we aimed to assess the effects of NPY on OA induced diarrhoea.

**In vivo assay.**
1. Mice were placed individually in metabolic caged and fasted overnight (5% glucose serum).
2. Animals were given 450 μg/kg NPY followed by 500 μg/kg OA 15 minutes afterwards.
3. Food and water were provided ad libitum.
4. Information regarding diarrhoea onset, changes in body weight, food and water consumption (a), along with symptoms (c) were recorded.
5. During necropsy anatomopathological examination took place and samples from small and large intestines were removed and processed for Transmission Electron Microscopy (b).

**Symptomatology**

**Conclusion**
NPY pre-treatment improves OA-induced damage in colon epithelial barrier at 2 h of treatment.
