INTRODUCTION

The vine has always occupied an important place in the traditional Mediterranean landscape, by its presence in two forms: **wild** and **cultivated**

INTRODUCTION

The introduction of new grape varieties has generated a genetic erosion of the viticultural heritage.

INTRODUCTION

Ignorance of our vine heritage and the lack of a catalog described and behavior of these grape varieties

Recognize the local phylogenetic heritage, and the plant genetic wealth that the country conceals.

INTRODUCTION

Characterize native grape varieties, facilitate their recognition and contribute to the conservation and protection of all this varietal diversity.

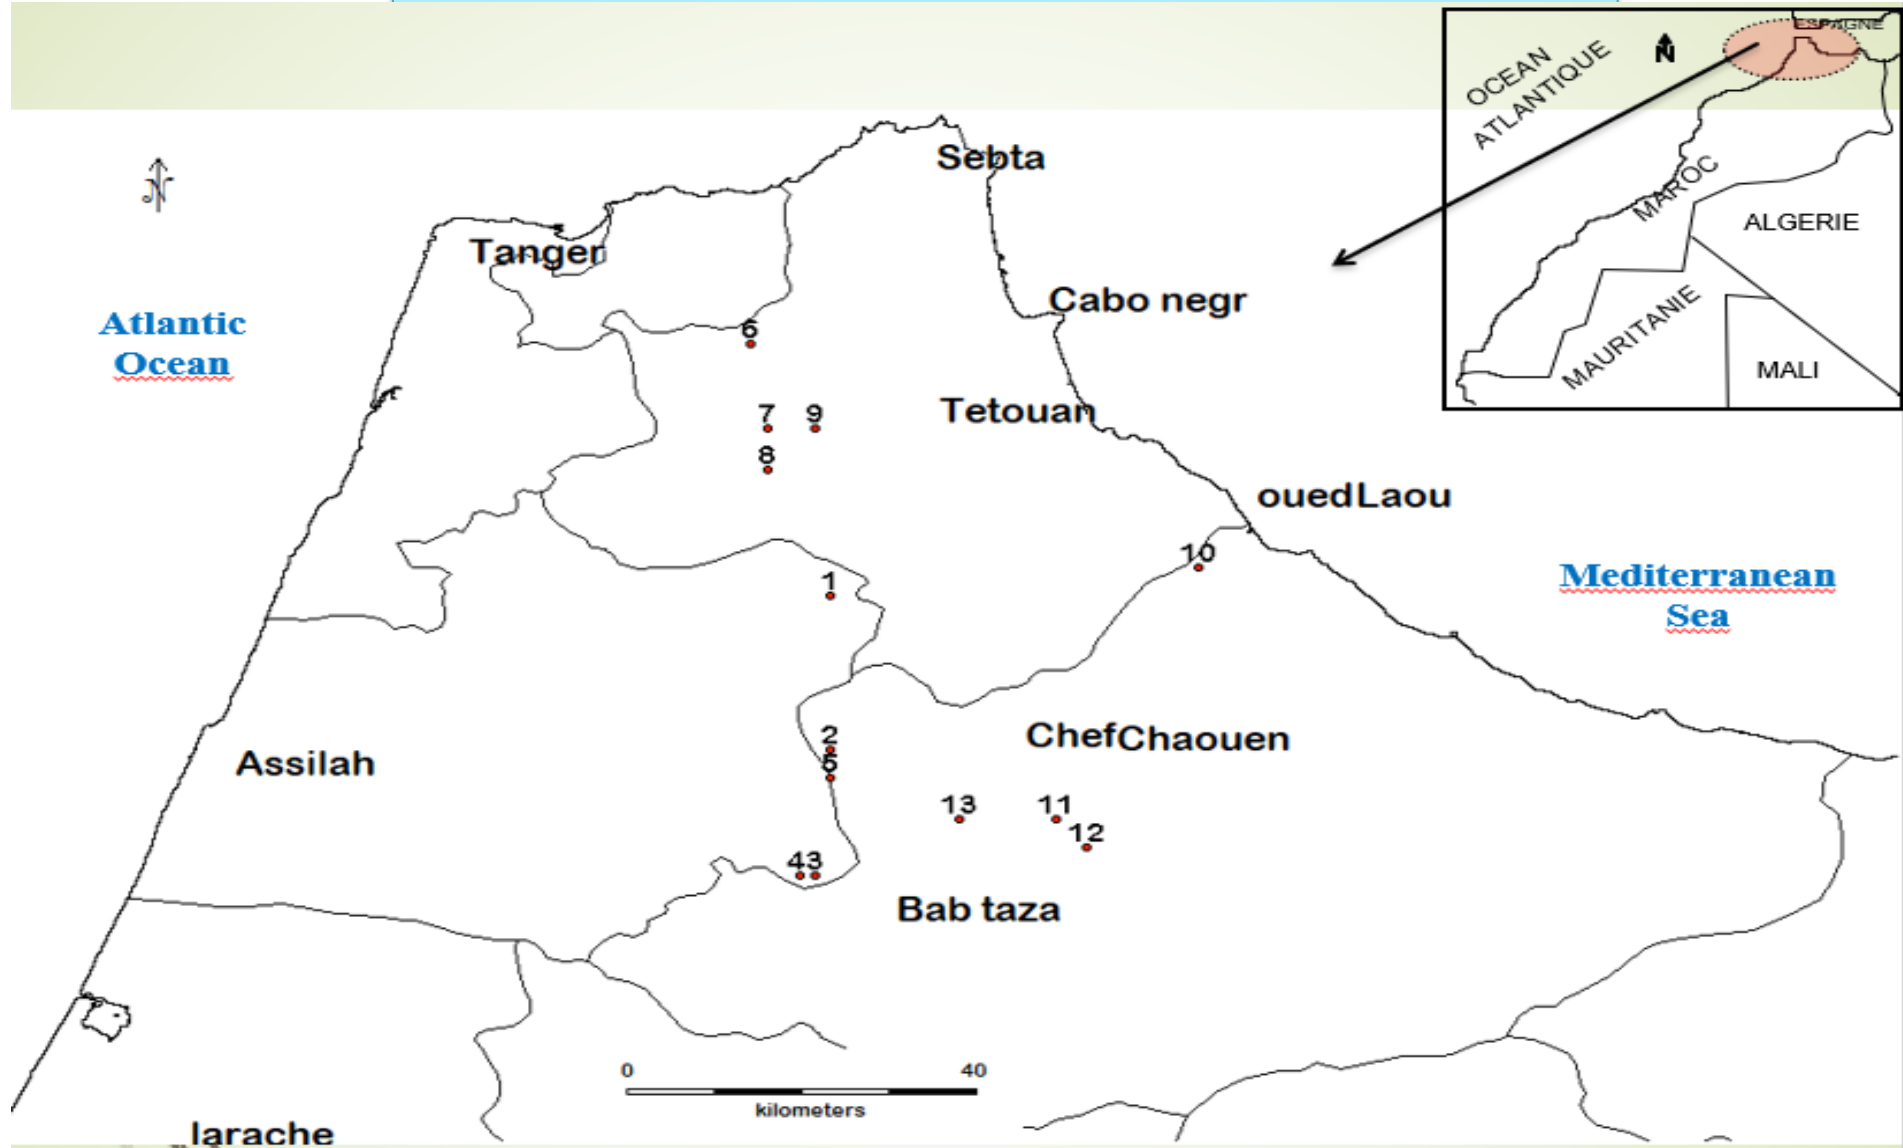

Study of biodiversity in the Rif Mountain's traditional agroecosystems

Ampelometric and ampelographic approach

Results and discussion

Analysis of the variance

Characters with very high F :

- Size and base of the teeth (HD, BD),
- Shape of teeth (HBD1),
- Petiole opening angle (PI)
- Surface (Area)

Results and discussion

Principal component analysis

Axis 1 is correlated with:

- Width of the leaf (LA),
- Length of the leaf (LU),
- Length of the nervures and sides (N1, N2, N3, N4 and N5),
- Distance between the extremities of the nervures (N2-N21, N3-N31 and N4-N41),
- Length of the leaf including the petiole (LUPIC),
- Area (Area)
- Length of the petiole (OP).

conclusion and perspectives

The study was based on the morphological characteristics of the leaf, it has been shown that there is a important variability of intra and intervarietal.

Highlighted diversity in a small and relatively limited territory

THANK YOU FOR
YOUR ATTENTION

The authors thank the farmers of the various villages who contributed to the realization of this study. This research Was funded by ARIMNET 2 Project "MedVItis" Convention No. 7.
